Diarrhea was controlled in 8 of the 10 cases after three days of therapy and in the fatal case after four days of treatment. The other patient (G R) continued to have diarrhea for fourteen days while receiving sulfaguanidine and was therefore treated with succinylsulfathiazole. (This case is included in both groups 2 and 3.)

Stool cultures became negative in 5 cases after three days of sulfaguanidine therapy. In 4 cases cultures of the stools were not taken at frequent enough intervals to determine the exact date on which the feces were rendered free from pathogenic organisms. In the patient who was later treated with succinylsulfathiazole

Chart 4—Fatal termination in a case treated with succinylsulfathiazole for twelve days.

(G R) stool cultures were positive on the eleventh day of sulfaguanidine therapy.

Group 3 (treated with succinylsulfathiazole). Fourteen of the 24 cases treated with succinylsulfathiazole are included in this group, one of these cases (S S, chart 3) was previously discussed among the untreated cases and another (G R) was included among those treated with sulfaguanidine. The duration of fever in this group was comparable to that observed in group 2.

6 Bratton A. C. and Marshall E. K. Jr. A New Coupling Component for Sulfanilamide Determination. *J. Biol. Chem.* 128: 537 (May) 1939.

7 In group 1 is included a patient who later was given succinylsulfathiazole and is therefore also included in group 3. In group 2 is 1 patient treated first with sulfaguanidine and later with succinylsulfathiazole and this case is also included in group 3.

In the 1 fatal case in this group the temperature continued elevated for fifteen days, in 1 case it remained elevated for eight days and in another for five days. Five other patients became afebrile after three days of treatment. In the remaining patients in this group the temperature was normal at the time succinylsulfathiazole

Chart 5—The development of a carrier state in a case treated with small doses of succinylsulfathiazole. Later cured with larger doses

zole was started and remained normal throughout the period of treatment

Diarrhea was controlled in 11 of the 14 cases after three days of therapy. Of the 3 remaining patients in this group 1 had no diarrhea when therapy was begun, 1 had diarrhea for six days and the last patient (D P, chart 4) represented the 1 fatal case in this group. This man was 81 years old and had been hospitalized for more than one year because of atherosclerotic heart disease. Treatment was started on the third day of the disease, but in spite of the fact that the dose was increased to approximately 0.5 Gm per kilogram of body weight daily he had bloody stools almost constantly and died on the fifteenth day of the illness.

Cultures of the stools from 12 of the 14 patients of this group were taken daily, thus the exact day on which stools became negative could be determined. In 10 of these 12 cases the stool cultures were negative after three days of treatment, of the other 2 cases stool cultures remained positive for six days in 1 and twelve days in the other (D P, chart 4).

Chart 6—Drug fever occurring with the administration of sulfaguanidine and later produced by the readministration of the same drug. No fever following the readministration of succinylsulfathiazole

One of the patients in this group (G W, chart 5) received 0.15 Gm of succinylsulfathiazole per kilogram of body weight initially and 0.15 Gm per kilogram daily for approximately four days. Throughout the period of treatment and for the next sixteen days eleven stool cultures were negative. Then on six consecutive days the stool cultures were positive. A second course

of succinylsulfathiazole was given, using 0.5 Gm per kilogram as the initial dose and the same amount daily in six divided doses for four days. The stool cultures became negative after one day on this dose and remained so throughout an observation period of twenty-three days.

BLOOD CONCENTRATIONS OF THE DRUGS

The blood sulfonamide concentrations and the corresponding total dosage of drug administered at the time of the determination in the sulfonamide treated patients are summarized in table 1. Although the values obtained for blood concentrations of sulfaguanidine in this series of cases are comparable, for the most part, with the values reported in other investigations, we observed 2 patients in whom unusually high concentrations occurred. In 1 case a blood concentration of 10 mg per hundred cubic centimeters was observed following the administration of 81 Gm of sulfaguanidine in eight days. In the other case a blood concentration of 16.6 mg per hundred cubic centimeters followed the administration of 27.5 Gm of sulfaguanidine in three days.

TABLE 1—Total Dosage and Corresponding Blood Concentrations of Sulfaguanidine in Twelve Cases

		100.0	11.4

The blood sulfaguanidine value in the latter case is higher than any values previously reported, the highest reported value with which we are familiar is 10 mg per hundred cubic centimeters.⁸ The values for blood concentration of succinylsulfathiazole in this series were consistently low and are comparable with the values reported by others.⁹ In no instance did the free sulfathiazole exceed 1.39 mg per hundred cubic centimeters or the total succinylsulfathiazole 1.45 mg per hundred cubic centimeters.

Toxicity—Slight vomiting occurred in 1 case with each drug. No nausea, rash or hematuria was observed. Sulfonamide crystals were found in 6 of the 10 patients who received sulfaguanidine and in 10 of the 14 who received succinylsulfathiazole. These urine specimens were examined four to six hours after voiding. Because the presence of crystalluria had not been previously reported in patients who had received succinylsulfathiazole, we administered this drug to 10 patients hospitalized for other conditions and who were in a normal

⁸ Kirsner J B, Rodnicke Enid C and Palmer W L. Use of Sulfaguanidine in Nonspecific Ulcerative Colitis and Other Infections of Bowel. *Am J Digest Dis* 9: 229 (July) 1942.

state of hydration. Urine specimens were collected after four days of administration of this drug and were examined within one hour after voiding. There were no sulfonamide crystals in any of these cases.

One patient (J F, chart 6) who received sulfaguandine developed a drug fever. At the time this drug was started his temperature was 102 F and after four days of therapy it had returned to normal. Sulfaguandine was continued for four more days, at which time his temperature again rose to 102 F. This second

lar toxic reaction followed the readministration of succinylsulfathiazole. However, when sulfaguandine was given for a third time the temperature rose to 101.6 F.

This observation led us to investigate further the readministration of each of these drugs. Eight other patients who had previously received sulfaguandine

elevation in temperature was at first thought to be a result of continued gastrointestinal infection and because sulfaguandine was apparently not effective it was discontinued and succinylsulfathiazole substituted. After three days of treatment with the latter drug the temperature returned to normal. A later analysis of the case revealed that during the second febrile period there was no diarrhea and the stool cultures were negative. This suggested that this fever was due to drug sensitivity rather than to continued bacillary infection. Therefore, twelve days after sulfaguandine was discontinued the patient was again given 4 Gm of this drug in one dose. Three hours later he became dyspneic and cyanotic and his temperature rose to 102 F but returned to normal within forty-eight hours. No simi-

Chart 7—The occurrence of fever during the readministration of sulfaguandine

were given a second course of the drug, and 2 of these exhibited febrile reactions. That these patients were sensitive to this drug was further demonstrated by the production of similar reactions during a third course of the drug. These cases are illustrated in charts 7 and 8.

Twelve patients who had previously been treated with succinylsulfathiazole were given a second course of this drug and in no case did a febrile reaction occur.

The occurrence of febrile reactions following the readministration of sulfathiazole was first reported from this hospital by Lyons and Balberor.⁹ The present study indicates a similar hypersensitivity to the readministration of sulfaguandine.

CONCLUSIONS

It is evident from this study of 28 cases that both sulfaguandine and succinylsulfathiazole are of distinct value in the treatment of acute bacillary dysentery (Flexner). It must be emphasized, however, that failures have occurred following the use of each of these drugs. Because succinylsulfathiazole is equally effective, and because it is without the potential toxic effects of sulfaguandine, we believe that it is the drug of choice in the treatment of acute bacillary dysentery (Flexner).

Chart 8—The occurrence of fever during the readministration of sulfaguandine

We consider that succinylsulfathiazole given in doses of 0.25 Gm per kilogram initially and 0.25 Gm per kilogram daily for at least six consecutive days was adequate to effect a cure in 12 of 14, or 85 per cent, of our cases. We observed that doses of twice this

9 Lyons, Richard H. and Balberor, Harry. Febrile Reactions Accompanying the Readministration of Sulfathiazole. J A M A 118: 955 (March 21) 1942.

amount may be administered without untoward reactions and it is suggested that if fever and diarrhea are not controlled after three days of therapy with the smaller doses twice the amount of the original dose be given.

We wish to stress the importance of repeated stool cultures for at least three weeks after therapy has been discontinued. Although the final decision regarding the value of succinylsulfathiazole will require further clinical use, the results of this comparative study indicate that it is a definite advance in the treatment of this important enteric disease and may prove to be of great value in the treatment of other types of bacillary dysentery.

THE PREVENTION OF EAR DISABILITY IN INDUSTRY

REPORT ON THE USE OF A PLASTIC MOLD

DAVID A. McCOY, M.D.
BOSTON

The innocuously progressive loss of hearing as encountered in industrial work associated with continuous exposure to noise has been a refractory disability problem. This is so not only by reason of the lack of an adequate treatment but also because essential precautions are imperfect and rarely instituted. Perhaps this is largely due to the fact that there has been no remedy which is both efficient in its function and acceptable to the worker.

TYPES OF EAR DAMAGE

The significance of "boilermaker's ear" is well known among workers. In otologic practice it represents the clinical entity due to acoustic trauma. The deafness is relative to prolonged and repeated exposure to loud noises and particularly loud sounds of the high frequency range. In present day industry there are two factors which have accentuated the possibility of this disability. There is a demand for an unparalleled speed of production requiring an added number of men in limited areas in which there was already sufficient noise to be hazardous. An example of this is the work on the airplane assembly line and specifically in the shipyards, where work in confined areas such as in the double bottoms of transports is required. In the latter instance men with pneumatic chipping hammers must follow the welding bead along the side of the ship, and the resultant noise is sufficient to cause even a passerby on the outside of the hull to experience discomfort.

For a point of reference the threshold of immediately painful sound varies between 112 and 129 decibels, depending on the frequency. The higher the frequency the lower the threshold of painful sound. An airplane propeller has an intensity level of approximately 120 decibels. A rivet hammer or a chipping hammer may be estimated at 115 to 140 decibels, depending on the distance from the hammer at which the noise level is taken. A stream of air under high compression (150 pounds) passing out the customary $\frac{5}{8}$ inch diameter outlet varies from 105 to 130 decibels when 2 feet to 6 inches from the opening. In comparison, conversational speech at 10 to 20 feet varies from 68 to 30 decibels. It should be remembered that the effect of the noise on the ear is also directly related to the duration of exposure as well as to the distance from the source.

A type of ear damage not seen frequently before is now confronting the industrial physician. With the advent of the intensive use of welding and the resultant necessity for the chipping of the weld metal, direct damage to the ear canal drum and middle ear is becoming common. The small flying balls of hot slag to which the worker is exposed as he works in various positions ricochet through the ear canal, leaving damage both from burning and from trauma. In this type of work there is a continuous dispersion in all directions of these metallic particles requiring the worker to be outfitted in stiff thick leather to protect his body.

PREVIOUS METHODS

The use of cotton in the ear is an old standby and, though not effective in reducing the noise, does serve to keep out foreign material. Rubber ear stoppers have been used but, owing to the molding required of the plug to accommodate its presence in the canal, points of pressure develop which prevent their use over too long a period of time without symptomatic reaction. As a result of this they are usually kept in the pocket or thrown away. The use of material such as paper and rags is unsanitary and hazardous but a common practice.

By audiometric reading cotton lowers sound 10 to 15 decibels, depending on the efficiency with which it is packed in the canal. Rubber ear defenders lower sound 20 to 25 decibels. The plastic ear mold lowers sound 25 to 30 decibels in the speech range and 30 to 40 decibels in the high frequency range.

THE PLASTIC EAR MOLD¹

The problem has been to have an ear stopper which not only eliminates the hazards of intensive noise and stops the entrance of foreign material but also is so acceptable to the worker that he will permit its use for long and repeated periods. In order to fulfill these

requirements the ear canal was plugged just below the beginning of the bony portion with two small wads of cotton. Wet plaster was then put into the remaining outside portion of the canal and the immediately related portion of the concha. This is easily removed when hardened, carrying with it the uppermost piece of cotton. The other piece of cotton is removed and the plaster cast is

Fig. 1—General shape of ear mold.

transformed through a mold into an exact reproduction in transparent plastic lucite. This procedure has been used for years to produce the perforated ear unit for hearing aids. Thus each ear has its individual plastic mold stopper, which carries the obvious advantages of having no pressure points, of eliminating

completely the danger from foreign material and of definitely reducing the intensity of the noise.

In addition it may be said that the plastic withstands heavy blows, is noninflammable, will not shatter and cut the wearer, and has a relatively low coefficient of expansion. It is nonresistant to alcohol. Also the mold causes no inconvenience to the wearer, for once in place the upper portion of the mold and the lower portion to a lesser degree lock behind the overlapping roll of the concha, preventing its coming out without careful manual removal.

Fig. 2—How ear mold fits into ear

EFFICIENCY OF THE PLASTIC EAR MOLD

Audiometric examination reveals that loud noises are reduced approximately 30 to 40 decibels, yet the ordinary conversational tone is distinguished without trouble.

In the California Shipbuilding Corporation thirty workers who were exposed to noise in various occupations were fitted with ear molds. These workers included welders, chippers, burners and buffers. After a period of ten days' use these workers were subjected to questioning with the following results:

QUESTIONS AND ANSWERS

1 Q—How did the sharp clattering noises and sounds in your work affect you? A (representative)—Chipper: "I had to quit and get away from it every ten minutes or so to get relief. I was trying to get a transfer into the open. At the end of the day my head always ached and my ears rang." Burner: "In tight places noise hurts. When the day is over you can't hardly hear. The wife claimed I was irritable and the ringing bothered my sleep."

2 Q—How effective are the ear molds in reducing these noises? A—All stated that the intense noise was eliminated.

3 (a) Q—Have you had trouble with foreign matter in your ears? A—Most complained of dust and rust scale, particularly the scalers and buffers. Five had had slag burns of the ear. Two of these had had ear drums ruptured from flying hot metal, a permanent disability was evident in one of the two.

3 (b) Q—While wearing the ear molds were you bothered by foreign matter? A—In no case did the molds fail to keep out the foreign material.

4 Q—How do the ear molds fit your ears? Is there any irritation? Are they comfortable? Are they easy to manipulate? A—The ear molds caused no irritation. The men wore them constantly without removing them during their working hours. All stated that they were comfortable and easy to manipulate in and out.

5 Q—Do you find that the ear molds help you in your work in any way? A (represented most clearly by actual quotation)—"That noise was a big distraction but these molds took that away. I believe I do more work in a day now." "These are aces high. My ears are not under pressure any more." "I can hear the fellows talk but the noise is gone."

6 Q—Does wearing the ear molds during working hours affect your leisure hours? (This question was asked because a large percentage of the men entering the field hospital

complained of ringing in the ears, partial deafness, nervous irritability and occasionally trouble in sleeping. Most of these cases of temporary partial deafness and ringing in the ears were relieved automatically by morning, but there was some complaint of continued trouble.) A—Relief in all cases of irritative symptoms after working hours was experienced.

7 Q—How do these ear molds compare with other ear stoppers you have tried? A—The ear molds were given preference. The objections to other types were those outlined earlier.

Knowing the obvious disadvantages of accepting this type of evidence as accurate, it nevertheless serves to establish the point that the molds are acceptable to the worker. In support of this is the fact that approximately five hundred workers have voluntarily bought these molds without any advertising by the ear mold company.

SUMMARY AND CONCLUSIONS

A new type of ear stopper, a plastic ear mold, offers as its advantages:

- 1 It is relatively indestructible.
- 2 It is efficient in diminishing intense and high frequency noises, yet permits conversation.
- 3 It is a sure block for foreign material.
- 4 It is light, transparent and easily cleaned.

The finished product is a die cast reproduction of a plaster model. Each ear being different, a new plaster cast is made for each and every stopper. Thus the exactness of fit is obtained to eliminate sound leaks and to prevent irritating points of pressure.

A trial of 30 cases was made by pertinent questions following two weeks' usage.² The following conclusions therefore seem justified:

- 1 The hazard of loud noise can be eliminated by these plastic ear molds.
- 2 Slag burns and foreign bodies involving the ears can be prevented.
- 3 Elimination of prolonged and repeated exposure to noise is obtained with the resultant eradication of irritative symptoms which should allow greater concentration on the job and increase of production.
- 4 A solution is thus offered for certain industrial ear problems.

² Trials made at California Shipbuilding Corporation. David A. McCoy, M.D., chief of eye, ear, nose and throat department.

The Changes in an Apple—The manufacturer of foodstuffs is the plant. It takes carbon dioxide from the air and water from the soil and builds up complex compounds by means of the energy furnished by the sun's rays. The simplest compounds formed from carbon dioxide and water are formaldehyde and simpler acids related to formaldehyde. Acids appear first in the process of synthesizing food substances. Because of this fact, unripe fruit is sour. A boy who steals an apple in September makes a "sour" face. But the plant is industrious. It repeats the process, combining 2, 4, 6 molecules of formaldehyde, giving rise to sugar. In October the acids in the apple have been transformed into grape sugar, and the apple is sweet. Now man reaps the crop, but the plant continues to manufacture. It combines 2 molecules of grape sugar to form malt sugar, malt sugar molecules combine to form dextrin, and by uniting dextrin molecules the plant makes starch. In November the apple loses its sugar and becomes mealy. Then the plant combines starch molecules to form cellulose. In December the apple is no longer sour, sweet or mealy but as tough as wood.—Kahn, Fritz. *Man in Structure and Function*, volume 1 translated from the German and edited by George Rosen, M.D., New York, Alfred A. Knopf, 1943.

JAUNDICE OCCURRING ONE TO FOUR MONTHS AFTER TRANSFUSION OF BLOOD OR PLASMA

REPORT OF SEVEN CASES

PAUL B. BEESON, M.D.

ATLANTA, GA.

The purpose of this communication is to report 7 cases of jaundice which occurred one to four months after transfusions of whole blood or plasma and to suggest that these illnesses were probably caused by the transfusions.

There are on record a number of instances in which inoculation of groups of people with human plasma, serum or lymph has resulted in outbreaks of an illness resembling catarrhal jaundice. A distinctive feature of these cases has been a long incubation period, varying between four and thirty weeks, the majority being between eight and eighteen weeks. The first large outbreak occurred in 1883-1884 among workers in a Bremen shipyard, who were vaccinated with human lymph derived from cases of vaccinia. From one to seven months later 191 of 1,289 persons became jaundiced, while 500 other workers in the same shipyard, vaccinated with a different lot of lymph, remained free of the disease.¹ In England in 1937-1938, 41 cases of jaundice occurred among a group of 109 children who had been inoculated with a preparation of human convalescent plasma for passive protection against measles. Yellow fever vaccination, using vaccines containing human serum, has been the cause of several outbreaks of hepatitis. These occurred in England,² in Brazil³ and recently in American soldiers.⁴ Evidence has pointed to the human serum in the vaccines as the source of jaundice in each of these outbreaks, as a consequence, the vaccines now being used are made without human serum.

A memorandum has recently been issued by the British Ministry of Health on the subject of "Homologous Serum Jaundice."⁵ This document supplies details of the hepatitis referred to previously which followed measles convalescent plasma. In addition, an outbreak of jaundice is described involving 86 members of a group of 266 soldiers who had been inoculated with convalescent plasma from mumps patients. Finally it is stated that 12 cases of jaundice have been reported, from several sources, in persons who had previously been given transfusions of plasma or of whole blood. The memorandum contains useful data on the clinical manifestations of this form of hepatitis.

The clinical features of these illnesses have resembled to some extent those of common infective hepatitis or catarrhal jaundice. Certain manifestations, however,

have been noted in the "homologous serum" cases which may assist in clinical differentiation. Urticaria and various types of erythema are described. For example, skin rashes were noted in 41.7 per cent of the "mumps plasma" cases. Also a transient generalized arthritis has been an early manifestation in some instances. In most cases the symptoms were mild, but some of the affected persons were severely ill, and deaths occurred. In the cases among American soldiers which followed yellow fever vaccination the fatality rate was stated to be about 0.2 per cent, but in the English children who received measles convalescent plasma the disease was apparently much more severe, there being eight fatalities among 41 cases.

Comparable with the foregoing experiences in human beings are some observations which have been made in horses. Jaundice has been noted in horses from one to six months after they have received injections of horse blood or serum given for the purpose of immunization against such diseases as African horse sickness,⁶ equine encephalomyelitis,⁷ anthrax⁸ and grass sickness.⁹

The cause of these diseases has not been established, although a number of theories have been suggested.¹⁰ The explanation which has generally been favored is that the jaundice is caused by a virus which happened to be present in the body fluids of the donors and which, after a long incubation period, produced a hepatitis in the recipient. Another suggestion is that this disease is the result of an immune mechanism in which, following inoculation with homologous blood or plasma, an individual develops antibodies which cause injury to his own tissues.

The connection between the preceding inoculation and the subsequent jaundice has been recognized in previous instances because of the simultaneous occurrence of a considerable number of cases among persons who had all been inoculated with a single material. It is reasonable to suppose that this sequence of events may have occurred on other occasions, involving smaller numbers of persons, and that the relationship may have been overlooked because of the long interval which elapsed between the inoculation and the subsequent jaundice. Recently 2 patients (1 and 2) have been treated in Grady Hospital in each of whom jaundice had occurred several weeks after transfusion of blood or plasma. In addition, examination of the hospital records for the years 1940, 1941 and 1942 revealed 4 more examples (cases 3, 4, 5 and 6). These were among a group of 79 cases in which a diagnosis of "acute catarrhal jaundice" or "toxic hepatitis" had been made. Thus in one hospital, among a total of 81 persons ill with "catarrhal jaundice" or "toxic hepatitis" there were 6 who had recently received transfusions. The seventh case which I am reporting was noted by Dr. Charles Harris in a relative of his who underwent a subtotal gastrectomy at Emory University Hospital, Atlanta. The patient received several transfusions at the time of his operation. On recovery from the operation he returned to his home in Texas, and there, approximately three months after the transfusions, he developed jaundice. He was not admitted to a hospital, but sufficient information has been obtained to show

that his illness was similar clinically to those of the other patients in this series. A diagnosis of "catarrhal jaundice" was made by his attending physician.

The principal data of the 7 cases are presented in the accompanying tables. The clinical diagnosis which had been made in 6 of them was "acute catarrhal jaundice," while a diagnosis of "toxic hepatitis" had been made in 1 case (6). None of the patients were severely ill.

A point of interest is the fact that a skin eruption and joint pains were the initial symptoms in case 3 and that in case 6 the initial symptom was a generalized urticaria. As noted previously, skin eruptions and arthritis have occurred frequently in "homologous serum jaundice."

Four of these 7 patients received four or more transfusions, involving relatively large volumes of blood or

TABLE 2—Clinical Features of Seven Cases of Jaundice Following Transfusions

Case	Symptoms	Physical Examination	Course of Illness	Laboratory Findings
1	None except jaundice	Moderate jaundice of scleras and skin. Liver edge just palpable. Not tender. Spleen not felt.	Admitted on 3d day of illness. Remained 40 days. No fever. Always felt well. Jaundice increased first 3 weeks then began to fade. Still a faint trace 105 days after onset.	No anemia. Leukocytes 10 800. 78% polys. Urine gave 4+ test for bile. Urine contained bile on admission. Not on discharge. Feeces contained no bile first 10 days. Icterus index 40 on admission. Rose to 80. Fell to 12.
2	Anorexia. Headache. Epigastric pain. Vomiting. Cream colored stools. Constipation. Dark urine.	Jaundice of scleras and buccal mucosa. Moderate tenderness in right upper quadrant. Liver and spleen not felt.	Admitted on 2d day of illness. Remained 28 days. No fever. Symptoms subsided after 3d day in hospital.	No anemia. Leukocytes 6 500. 72% polys. Urine gave 4+ test for bile. On admission trace 7 days later. Feeces always positive for bile. Icterus index 44 on admission. 98 5th day. 19 12th day.
3	Onset with headache. Swelling and tenderness of knees. Elbows. Fingers and toes. Second day numerous red bumps on feet and ankles. Third day nausea. Vomiting. Anorexia. Felt feverish. Severe palpitation.	Paroxysmal auricular tachycardia (this occurred also during previous hospital admission). Tenderness and swelling of all joints. Jaundice of scleras and skin. Noted on second hospital day. No abdominal tenderness. Liver and spleen not felt.	Admitted on 9th day of illness. Remained 12 days. Daily temperature elevation 99.100 first 6 days. Normal thereafter. Pain in left side of epigastrium first 2 days. Comfortable thereafter. Tachycardia controlled by quinidine. Jaundice diminished on discharge. Not noted at follow up 2 weeks later.	No anemia. Leukocytes 6 850. 64% polys. Urine never gave positive test for bile. Feeces not examined for bile. Icterus index 29 on admission. 44 on 8th day.
4	Crampy epigastric pain. Vomiting. Anorexia. No change in color of urine or stools.	Jaundice of scleras and skin. Slight tenderness in right upper quadrant. Liver not felt. Thought to be small. Spleen not felt.	Admitted on 5th day of illness. Remained 25 days. Symptoms subsided after few days. Jaundice diminished while in hospital.	No anemia. Leukocytes 6 200. 77% polys. Urine positive for bile on admission and also 7 days later. Negative 7 days after that. Feeces always contained bile. Icterus index 133 on admission. Fell steadily to 28 on discharge.
5	Nausea. Vomiting. Epigastric fullness.	Jaundice of scleras and skin. Dehydration. Liver and spleen not felt. No tenderness.	Admitted on 4th day of illness. Remained 14 days. Comfortable after 4th day. Jaundice fading on 10th day and no longer evident 5 weeks after onset.	No anemia. Leukocytes 6 450. 72% polys. Urine positive for bile on 2d day. Negative on 14th day. Feeces always contained bile. Icterus index 36 on 2d day. 20 on 9th day.
6	Onset with urticaria all over body. 3 days later headache. Anorexia. Epigastric pain. Nausea and vomiting. Chills noted. Jaundice on tenth day.	Jaundice of scleras. No tenderness. Liver and spleen not felt.	Admitted on 15th day of illness. Remained 44 days. Little change in icterus. No further gastro-intestinal symptoms.	No anemia. Leukocytes 6 500. 72% polys. Urine gave 4+ test for bile on admission. Only a trace 7 days later. Feeces always contained bile. Icterus index 25 on admission. 67 on 9th day. 33 at time of discharge.
7	Nausea. Anorexia. Vomiting. Feverish. Light colored stools. Dark colored urine. Jaundice noted on sixth day.	No record.	Stools remained light in color for 12 days. Urine was dark for 20 days. Jaundice evident for 34 days. Lost 15 pounds in weight. Then rapidly regained it. Attending physician made diagnosis of catarrhal jaundice.	No record.

plasma This is probably significant only to the extent that the risk of receiving a jaundice producing substance in a transfusion may be increased in proportion to the number of donors from whom blood or plasma is received The volume alone does not seem to be an important factor, since the volume of human serum or plasma which caused the postvaccination cases was comparatively small It has not been possible to trace the donors of the blood or plasma given to these patients¹¹ However, in some previous outbreaks of this disease the donors have been traced and have not presented any evidence of illness subsequent to the time at which they gave blood

Three coincidences in dates appear in this series of cases Patients 3 and 4 were given transfusions on the same day, Jan 5, 1941 However, since 1 was white and 1 a Negro, and since flasks of blood are never pooled, there is almost no possibility that they received any of the same material Patients 1 and 7 received multiple transfusions between Aug 24 and Sept 10, 1942 They were in different Atlanta hospitals In cases 5 and 6 the onset of symptoms occurred on the same day, June 12, 1942, although patient 6 had received her transfusion more than three weeks earlier than patient 5 The significance of these coincidences cannot be decided at present

The present large scale use of blood and plasma transfusion may lead to the occurrence of a considerable number of such cases of hepatitis It seems highly probable that they may be occurring not infrequently but are not being recognized If one were not aware of the fact that jaundice may follow inoculation with homologous serum or plasma after a long latent period, one would be unlikely to attach any significance to a history of transfusion three months previous to the onset of a patient's illness The real frequency of this complication of transfusion will be known only when there has been a concerted effort by physicians to recognize such cases

Two practical measures are indicated for the investigation of this problem First, a careful record should be kept of the source of blood or plasma administered to each patient Second a small portion of blood or plasma should be set aside at the time a transfusion is given, so that in the event of subsequent cases of hepatitis, some of the causative material will be available for study

SUMMARY

Seven persons who had received transfusions of blood or plasma at the time of injuries or surgical operations became ill one to four months afterward, with symptoms resembling those of catarrhal jaundice It is suggested that these illnesses were probably caused by the transfusions

Basis for the suggestion is a number of reported instances in which immunizations against different diseases, using homologous serum, plasma or lymph, have resulted in the occurrence of jaundice in significant numbers of the recipients A distinctive feature in these outbreaks has been a long incubation period, varying from one to seven months

Isolated cases, such as those reported here, may be occurring more frequently than is appreciated

11 The blood and plasma used in Grady Hospital are prepared as follows Blood is drawn into a liter flask containing sodium citrate The flask is sealed immediately and stored in a refrigerator at 5 C until needed It is never mixed with any other blood If a flask is not used within seven days the plasma is siphoned from the cells and pooled with plasma from three or four other flasks Whole blood there fore is derived from only one donor while plasma may be derived from four or five different donors

SIXTY CASES OF PNEUMOCOCCIC MENINGITIS TREATED WITH SULFONAMIDES

HORACE L. HODES, M.D.
MARGARET H. D. SMITH, M.D.
AND
HOWARD J. ICKES, M.D.
BALTIMORE

In 1939 one of us¹ reported 17 cases of pneumococcal meningitis treated with sulapyridine at Sydenham Hospital between October 1938 and May 1939 with recovery of 8 patients (47 per cent) We have since then had occasion to treat 43 more patients at Sydenham Hospital and at the Harriet Lane Home or the Johns Hopkins Hospital Since there is considerable variation in the mortality figures reported in case series from other hospitals it seemed to us worth while to report our own cases and analyze our experience

Prior to the introduction of sulfonamide therapy the mortality in pneumococcal meningitis was nearly 99 per cent The Goldsteins² reviewed the literature in 1927 and were able to collect 150 authentic reports of recovery from this disease Between 1930 and 1936 no specific therapy was used at Sydenham Hospital and all 29 patients died From December 1936 to October 1938 17 patients were treated with sulfanilamide at Sydenham and only 1 recovered At the Harriet Lane Home of 8 patients who received sulfanilamide 1 recovered but had severe residual damage to the spinal cord

In October 1938 sulapyridine came into use both at Harriet Lane and at Sydenham, since then sulapyridine, sulfathiazole, sulfadiazine or sulfapyrazine has been used in each case Our ideas concerning the details of treatment have changed gradually in the last three years, and we prefer not to establish a set routine of treatment However, we shall attempt to describe the general principles which we follow

METHOD OF TREATMENT

Sulfonamide Therapy—As soon as the diagnosis of meningitis is established by the presence of cloudy spinal fluid, a blood culture and nasopharyngeal cultures are obtained and the patient is then given the sodium salt of one of the sulfonamides intravenously Children are given 0.025 to 0.050 Gm of the sodium salt per kilogram of body weight, freshly made up in a 5 per cent solution with distilled water At the same time the patient receives 0.1 to 0.2 Gm per kilogram of body weight of the sulfonamide by mouth or, if unconscious, by stomach tube From then on approximately 0.2 Gm per kilogram of body weight is given every twenty-four hours, divided into six or eight doses Adults usually receive 3 Gm intravenously and 2 to 4 Gm by mouth as an initial dose, and 1.5 Gm every four hours

thereafter. During the early period of treatment the blood level of the sulfonamide is determined daily. In our first group of patients we attempted to maintain very high drug levels, but we find that our results are equally good with concentrations of 8 to 12 mg per hundred cubic centimeters and we rarely find it necessary to give the drug intravenously after the initial dose. The sulfonamide is usually continued for two weeks after the temperature has dropped to normal. It is not withdrawn unless the spinal fluid is sterile and has a normal sugar content and the patient appears well. Some of our patients showed definite clinical improvement within twenty-four hours of admission, but others who eventually recovered remained ill for as long as ten days.

Eleven of our 60 patients have shown some toxic effect of the sulfonamides. Of these 6 developed gross or microscopic hematuria. When this occurred early in the course of the disease the patient's fluid intake was increased and the hematuria cleared. When blood appeared in the urine at a time when the patient was clinically well, drug therapy was discontinued. Two of our patients developed "drug fever," 1 a drug rash and 2 showed leukopenia. All of the latter manifestations of sensitivity to the drug occurred during convalescence and not one was fatal.

Serum Therapy—In our first series of 17 cases previously reported¹ type specific antipneumococcus rabbit serum was not used. In our subsequent cases we have used serum for most of our patients under 2 years of age and for those older patients who seemed severely ill, especially when pneumonia was present. At first we gave the serum intravenously as soon as it could be obtained, usually within a very few hours after admission. We gave it in large amounts, with 80,000 to 100,000 units as an initial dose, so that several patients received 300,000 to 400,000 units in all and one as many as 750,000 units. If the patient did not respond rapidly to treatment he was given serum intrathecally. However, a number of the infants seemed to grow rapidly worse following these massive doses of serum. Accordingly we have modified our method of treatment as follows. On admission the spinal fluid is examined for pneumococci which if present, are immediately typed by the Neufeld-Sabin method. A culture of the spinal fluid is taken and its sugar content is esti-

Lumbar Punctures—A lumbar puncture is performed on admission for diagnostic purposes. It is repeated only if the patient fails to improve or if he develops a drug reaction and the condition of the spinal fluid must be checked before the sulfonamide is discontinued.

Fluids—These are given freely by mouth. We do not limit the fluid intake in order to maintain a higher drug level. In fact fluids are forced, especially when

TABLE 2—Results With and Without Serum Therapy

	With Serum			Without Serum		
	Died	Recovered	Total	Died	Recovered	Total
Under 2 Years	12	6	18	13	1	14
Over 2	4	7	11	6	11	18
Total	16	13	29	19	12	31

sulfadiazine is employed since a reduction in the fluid intake seems to contribute to the hematuria which is frequently encountered with this drug.

Sedation—Many of our patients are restless or wildly delirious. We feel that the safest drug in these cases is paraldehyde, administered intramuscularly or by stomach tube. We do not use morphine or codeine since these drugs even in small doses seem to cause respiratory depression in the presence of purulent meningitis.

Surgical Drainage of Foci of Infection—Mastoidectomy or surgical drainage of infected sinuses was originally thought to be of the utmost importance.⁴ We prefer to treat the patient conservatively, deferring operation until his general condition is greatly improved, i.e. usually for two or three weeks at least. We believe that this delay of surgical intervention has contributed to recovery in a number of our cases.

RESULTS OF THERAPY

With the method of treatment outlined, 22 per cent of the patients under 2 years of age and 64 per cent of those over 2 recovered, that is, 42 per cent of our 60 patients recovered. All of these received sulfonamide therapy. Twenty-nine of the patients received serum in addition. It is noteworthy that only 1 child under the age of 2 recovered without serum, whereas 13 died. Almost all of these, however, were critically ill on admission and died within twenty-four hours. We do not feel justified therefore in concluding definitely that the patients treated with serum have a more favorable outlook than those who receive sulfonamide therapy alone.

COMMENT

Pneumococci were cultured from the spinal fluid in all cases. The type isolated did not seem to alter the prognosis so far as we could determine from this relatively small group of cases.

In 1 case the pneumococcus obtained from the spinal fluid gave a positive Neufeld-Sabin reaction with both type VII and type XXIV rabbit serum. It is interesting to note in retrospect that although we treated the patient with both type specific serums, we were probably dealing with a single organism, namely type VII c. Kauffman, Morch and Schmith⁵ have shown that this organism and type XXIV share a common capsular antigen.

mated. If the patient is under 2 years of age, has pneumonia or seems severely ill, type specific rabbit serum is usually given intravenously, about twelve hours after sulfonamide therapy has been instituted. It seems to us that serum administered in this way causes fewer severe reactions. From 20,000 to 40,000 units is given as the initial dose. Subsequently from 20,000 to 40,000 units of serum is administered each day until it can be demonstrated that the patient's serum diluted 1:5 with isotonic solution of sodium chloride produces definite capsular swelling of a culture of the patient's own pneumococci. We no longer give intrathecal serum.

Two of our patients are interesting in that they had previously recovered from meningitis caused by another organism. R. B., a 4 month old Negro baby, was treated in the Harriet Lane Home for meningitis due to *Hemophilus influenzae*. He received concentrated anti-influenza rabbit serum, also sulfapyridine and sulfadiazine, a bilateral mastoidectomy was performed and the patient made a complete recovery. Two months later he returned and was found to have meningitis due to

11	1	1		31	1	1	
12	4	2	2	33	1	1	

the type VI pneumococcus. With type specific antiserum and sulfathiazole the patient again recovered completely and has remained well.⁶ G. C., an 8 month old Negro baby, was admitted to the Harriet Lane Home with septicemia and meningitis due to a group I meningococcus. He recovered slowly, but at the end of the second week in the hospital his temperature rose and a spinal puncture revealed the presence of type XIX pneumococci. These were still present three days later. The patient recovered under sulfapyridine therapy.

Linell and Robinson⁷ investigated 7 cases of pneumococcic meningitis which came to autopsy and emphasized that in such cases there is frequently evidence of previous trauma to the head. Injury in 3 of their cases had occurred as long as fourteen, five and two and a half years prior to the onset of meningitis. In only 1 of our cases could we elicit a history of previous head injury, and even here there was no evidence of skull fracture.

The blood culture from 33 of our 60 patients yielded a pneumococcus; of these, 13 (39 per cent) recovered. Of 24 patients the initial blood culture was sterile; of these, 10 (42 per cent) recovered. One patient who died was found to have hemolytic *Staphylococcus aureus* in the blood stream. In 2 cases no blood culture was taken. It seems that the presence or absence of organisms in the blood had little to do with the course of the disease.

It is well known that a primary focus of infection can frequently, though by no means always, be found in pneumococcic meningitis. In many of our patients otitis media of varying degrees of severity was present. One child was completely deaf on admission and had purulent otitis media for three days. Under sulfonamide therapy, without operative intervention, he recovered completely. A mastoidectomy was performed on 4 patients. Two patients showed purulent discharge from the sinuses, and it was necessary in 1 of these to drain the sinuses. Pneumonia preceded the onset of meningitis in 9 of the patients who died but only in 4 of those who survived.

All our patients have remained well since discharge and, with 1 exception, have no apparent sequelae. One infant, D. M., a 10 month old Negro boy, was treated with sulfathiazole and 500,000 units of antiscrum. His spinal fluid cultures remained positive for at least two months, and the baby was discharged from the hospital with symptoms of chronic meningitis, hydrocephalus and weakness of the right arm. At present he is 2 years old and appears to be of normal mental development. There is some residual weakness of the right hand but no indication of hydrocephalus.

Our series is too small to allow comparison of the relative efficacy of the different sulfonamides in pneumococcic meningitis. Suffice it to say that 19 of the 25 patients who recovered received sulfapyridine either alone or in combination with another sulfonamide. Three received both sulfadiazine and sulfathiazole, 1 received sulfadiazine and sulfapyridine, 1 received sulfadiazine alone and 1 sulfathiazole alone. It is our impression that all these drugs are probably equally effective in the treatment of this disease.

FACTORS INFLUENCING PROGNOSIS

Age—In reviewing our cases we have been struck by the difference in the recovery rate depending on the age of the patient. Only 22 per cent of our patients under 2 years of age recovered, in contrast to 64 per cent of those over the age of 2. One factor which contributes to the high mortality in infants is the delay in instituting treatment. The family does not recognize the serious nature of the illness in an infant as readily as in an adult, and the signs of meningitis may not be clear to the attending physician. Of our 32 patients under 2 years of age 10 died within twenty-four hours of admission. The high fatality rate among infants explains why only 27 per cent of the Harriet Lane Home patients recovered, whereas Sidsenham Hospital, where most of the patients with this disease are adults, had a recovery rate of 53 per cent.

Presence of Other Disease—Patients with congenital anomalies, chronic infections or some other acute infection in addition to meningitis have a poor outlook. Three of our patients who died had congenital syphilis, in 2 congenital malformations of the heart were discovered at autopsy, another was suffering from generalized peritonitis.

TABLE 4—Recoveries by Age

	Number of Cases	Recovered	Percentage Recovered
Under 2 years	32	7	22
Over 2 years	23	15	64
Total	60	22	42

Presence of Pneumonia—Patients who develop pneumococcic meningitis following pneumonia have, in general, a poor prognosis. This fact is noted by Dingle and Finland⁸ and is also borne out by our experience.

CONCLUSION

In our experience the mortality rate in pneumococcic meningitis is not so high as some authors have suggested. The sulfonamides and serum administered in adequate but not massive doses bring about an encour-

6 Zepp H. D. and Hodes H. L. Proc. Soc. Exper. Biol. & Med., to be published.

aging proportion of cures, except in the patients under 2 years of age. Moreover, however ill the patient may seem when first seen, one should not give up hope though it is true, by and large, that a patient admitted in coma has a grave prognosis. Several of our patients have recovered completely after appearing moribund on arrival.

SUMMARY

1 Sixty patients with pneumococcal meningitis were treated with sulfonamides.

2 Of these 60, 25 (42 per cent) recovered. Thirty-two of the patients were under 2 years of age, of these 7 (22 per cent) recovered. Twenty-eight of the patients were over 2 years of age, of these 18 (64 per cent) recovered.

3 While our experience with sulphyridine has been greater, the results obtained with the newer sulfonamides have been satisfactory.

THE RELATIVE VALUE OF PECTIN SOLUTION IN SHOCK

F. W. HARTMAN, MD
VICTOR SCHELLING, PH.D.
BROCK BRUSH, MD

AND
KENNETH W. WARREN, MD
DETROIT

Von Ziemssen in 1892, on the basis of clinical observations, was perhaps the first to note that in shock and hemorrhage "salt infusion was of benefit only for a short time as compared with blood transfusion." Blalock¹ sums up the present day view based on both clinical and experimental observations: "There is no doubt but that the intravascular volume can be temporarily increased by the direct introduction of salt solutions into the vascular system. Prompt temporary response of most patients with depleted blood volume to such treatment is well known. It is equally well known that this favorable response is often disappointingly transient, and the blood stream again becomes dehydrated and the circulatory impairment progresses in spite of the continued introduction of fluid. The introduction of aqueous solutions dilutes the plasma colloids in the blood stream. Tissue edema develops while the blood stream remains dehydrated. If there is extensive capillary damage so that protein escapes with fluid, the continuous administration of fluid by vein washes out more protein and as a result may actually reduce rather than increase the volume of circulating blood. What has been said applies to all crystalloid solutions, according to Amberson,² "no matter how ingeniously contrived."

Since the crystalloid solutions do not restore and maintain blood volume or blood pressure they obviously are not to be used in the progressive oligemic anoxia of shock. By the same token, solutions for the treatment of shock must contain colloidal constituents whose physical properties are such that they will remain in the circulation for extended periods, maintaining blood volume and blood pressure.

Blood plasma and blood serum have become thoroughly established as replacement fluids in shock, even when accompanied by hemorrhage, and are increasingly available in both military and civilian practice, so that they must now be considered standards for the evaluation of other colloidal solutions used for this purpose. Their dependability in restoring and maintaining blood volume and blood pressure needs no further elaboration.

TABLE 1—Chemical Analysis of Pectin

	Per Cent

or discussion, but the physicochemical mechanism by which this is accomplished unfortunately still is controversial. This is unfortunate because if settled the criteria would be better for the selection of colloidal fluids which are not derived from the blood or body fluids of either man or animals.

The intravenous use of pectin solutions for the prevention and treatment of shock was proposed earlier, and this communication is submitted as an evaluation and progress report.

SOURCE OF PECTIN

Braconnot in 1825 demonstrated the existence of pectin in fruits and vegetables. About the same time Fremy showed that pectin played an important role in the firmness of fruit during maturation. In citrus fruits pectin occurs largely in the white peel portion (albedo) just beneath the outer ring (flavedo). It is present with cellulose in a cold water insoluble form known as "propectin." Propectin is converted to pectin by slightly acid solutions. Hot acid solutions are used for extraction from fruit. After clarification and concentration pectin may be precipitated with alcohol, washed and dried. Only sound fruit is used for the production of pectin, as the enzymes from unsound fruit would greatly reduce the yield. Citric acid is produced from unsound fruit. Acid extraction and alcohol precipitation produce a pure protein free product—"pectinum" N F VII.

TABLE 2—Effect of Autoclaving at Fifteen Pounds (250 F) on Average Molecular Weight of Pectin Precipitated from 1 per Cent Solutions

Time of Autoclaving at 250 F. Hours	Pectin A		Pectin B
	Natural pH 3.3	Adjusted to pH 4.9	Natural pH 3.4
0	240,000	226,000	106,000
1/4	121,000	75,000	104,000
1/2	69,000	40,000	60,000
1	50,000	31,000	41,000
2	19,000	16,000	18,000

DESCRIPTION AND PHYSICAL PROPERTIES (JOSEPH)

Pectin is a coarse or fine powder, almost odorless and with a mucilaginous taste. It dissolves in cold or hot water, forming viscous opalescent colloidal solutions up to 5 per cent concentration. Hydrolysis produces pectic acid or pectates.

CHEMICAL CONSTITUTION

Pectin consists principally of partially methoxylated polygalacturonic acids and the formula, according to Schneider, is given in table 1.

From the Department of Laboratories and the Department of Surgery, Henry Ford Hospital.

Read before the Section on Pathology and Physiology at the Ninety-Third Annual Session of the American Medical Association, Atlantic City, N. J., June 11, 1942.

1 Blalock, Alfred: Principles of Surgical Care, St. Louis, C. V. Mosby Company, 1940.
2 Amberson, W. R.: Blood Substitutes Biol. Rev. 12: 48, 1937.

The pectin molecule is thought to be composed of chains of partially methoxylated galacturonic anhydride units. This molecule contains no protein or sulfur. The molecular weight is in the order of 150,000 to 300,000.

VISCOSITY AND MOLECULAR WEIGHT DEPENDING ON PREPARATION

In an earlier publication³ it was noted that unheated solutions of pectin were not well tolerated by animals. The unheated material tended to accumulate in the liver. Hueper⁴ has recently demonstrated that unheated pectin, like other macromolecular substances, is taken up by the reticuloendothelial system throughout the body. Heated or sterilized solutions, especially if the p_H was adjusted to 5 before sterilization, were found to be well tolerated in three different laboratory animals, and the

Ten Gm of dry pectin powder (pectinum) is dissolved in 1,000 cc of cold double distilled water with constant stirring. The resulting solution is turbid and is immediately filtered through coarse filter paper. Heating of the solution is then started in the Arnold sterilizer at temperatures of from 200 to 212 C. Heating is continuous for from fifteen to eighteen hours except for filtration through No. 50 filter paper three times, at intervals of four to five hours. At the end of the heating period and the four filtrations the solution is passed through bacteriologic Seitz filters with pressure into sterile bottles containing enough sodium chloride to make a 0.9 per cent concentration.

With this procedure the solutions obtained should be almost water clear and free of yellow color. The p_H

accumulation in the liver and other tissues proved slight and of short duration. This empiric finding has been adhered to in producing all subsequent solutions. The explanation lies in the partial hydrolysis with reduction in the viscosity and molecular weight, as illustrated by Joseph and Bryant in table 2.

It is noted in table 2 that autoclaving pectin A when the p_H was adjusted to 4.9 for fifteen minutes at 15 pounds reduced the molecular weight to 75,000 or to within the range of blood plasma.

METHOD OF PREPARATION

The usefulness of the pectin solution depends for the most part on the method of preparation and sterilization, hence the label should indicate the physical characteristics of the solution and also by what procedures those were obtained.

³ Hartman, F. W., Schelling, Victor, Harkins, H. N. and Brush Brock. Pectin Solution as a Blood Substitute, *Ann. Surg.* **114**: 212 (Aug.) 1941.

⁴ Hueper, W. C. Macromolecular Substances as Pathogenic Agents. *Arch. Path.* **33**: 267 (Feb.) 1942.

is about 3.5 and a buffer must be added before use. The buffer preferred is prepared by dissolving 285 Gm of sodium biphosphate ($\text{NaH}_2\text{PO}_4 \cdot \text{H}_2\text{O}$) in 1,000 cc of water and adjusting to p_H 7 with 10 per cent sodium hydroxide solution.

Before salting and buffering, a pectin solution prepared as described should have a viscosity at 38 C of 3, osmotic pressure 55 mm of mercury and molecular weight of 60,000 to 75,000.

Pectin solutions of 0.75 per cent, 1.5 per cent, and so on may be prepared in the same manner. Obviously the physical properties will be different from those of the 1 per cent solution described. For example, the 0.75 per cent solution prepared in a similar manner will have a viscosity at 38 C of 2 and an osmotic pressure of 45 mm of mercury, while the 1.5 per cent solution with the same preparation will have a viscosity of 4 at a temperature of 38 C and an osmotic pressure of 70 mm of mercury.

Pectin solutions of the various concentrations prepared according to the method described have more recently been reprecipitated with alcohol and desiccated to form a fine light powder which may be readily redissolved in sterile water, isotonic solution of sodium chloride or dextrose to make salted buffered solutions ready for immediate intravenous use. A report on the use of this latest solution will be given in a subsequent communication.

PHYSICAL EFFECT OF PECTIN ON THE BLOOD

In vitro pectin increases the sedimentation of the red cells in citrated blood and greater acceleration is seen in saline suspensions of red blood cells. The tendency to rapid sedimentation is reduced when the sterilized buffered solutions described are used. When pectin is given intravenously the sedimentation rate of blood removed is also increased. The rapid sedimentation does not apparently occur in the circulation, as no untoward symptoms were noted by patients and no evidence of this was found in animals coming to autopsy.

Chart 1—Plasma volume (Evans blue method) and hematocrit readings after intravenous injection of sterile 0.75 per cent pectin solution.

Coagulation time of the blood remained at normal levels and intravenous clotting has never been observed following the use of the solution described. Bleeding time was shortened corresponding to some degree to the numerous reports from 1925 to the present on the use of pectin as a hemostatic agent with local, oral, intramuscular and intravenous administration.⁵

INTRAVENOUS USE IN ANIMALS

The autoclaved 0.75 per cent solutions of pectin are well tolerated by the larger experimental animals in amounts of 40 to 60 cc per kilogram, provided it is given at rates of from 3 to 5 cc a minute. Very large doses and rapid administration result in vomiting and diarrhea.

These untoward symptoms may readily be explained on the basis of the large increases in blood volume demonstrated by the Evans blue dye method (chart 1). Apparently the material is retained in the circulation for three to four hours and may in addition draw some fluid from the tissues, hence with 40 cc per kilogram the

blood volume would be increased 50 per cent and with 60 cc per kilogram it would be increased 75 per cent. This is in contrast to electrolyte solutions, which leave the circulation almost as rapidly as they are injected if administered at 3 to 5 cc a minute. Another factor that contraindicates too large and too rapid infusion

Chart 2 (patient J. P.)—Plasma volume (Evans blue method) and hematocrit readings after the intravenous injection of sterile 0.75 per cent pectin solution. Solid line plasma volume broken line hematocrit. Smyth and Jacobson.

is the viscosity of 4, which is about the same as whole blood.

In experimental shock produced by hemorrhage in which 52 to 75 per cent of the blood volume was removed and replaced with pectin there was 100 per cent recovery (table 3). In contrast when 52 to 75 per cent of the animal's blood was removed and replaced with isotonic solution of sodium chloride, 3 out of 5 animals died (table 4). Kymographic records show that the blood pressure is readily restored and maintained by employing pectin solutions as replacement fluids.

Bile peritonitis employed by Harkins for the production of experimental shock invariably results in extreme hemoconcentration and death because of the large amount of exudation into the peritoneal cavity. However, pectin has proved quite effective in combating both the hemoconcentration and the fall in pulse and blood pressure. It appears to be as effective in prolonging life as any other measure, including blood and plasma transfusion.

Chart 3 (patient J. W.)—Plasma volume (Evans blue method) and hematocrit readings after intravenous injection of sterile 0.75 per cent pectin solution. Smyth and Jacobson.

Experimentally produced traumatic shock, such as bile peritonitis, is so measured as to be a lethal procedure, but here too pectin solutions are as effective in prolonging life as other measures.

Plasmapheresis is a difficult procedure, always accompanied by a high mortality when the plasma proteins

Kolloid Ztschr. 71: 214, 1935. Dietrich S. and Oettel H. Treatment of Hemorrhagic Diseases with Pectin. Deutsche med. Wchnschr. 65: 1690 (Nov. 5) 1937. Ragni Guglielmo. Blood Coagulation. I. Comparative Effects of Various Substances Which Accelerate Blood Coagulation. Boll. d. Soc. ital. di biol. sper. 13: 23 (Jan.) 1938.

are reduced below 1 per cent, but it has been readily accomplished by Whipple⁶ using saline solution with washed red cells, by Amberson² using gum-saline and washed red cells, as well as by many others. With pectin solutions there has been about 50 per cent mortality in our series, and 0.64 Gm per hundred cubic

Chart 4—Comparison of plasma volume changes following injection of pectin and saline solutions

centimeters was the lowest plasma protein level obtained (dog 15). Even this animal died on the third day from hemorrhage in its wound.

INTRAVENOUS USE IN MAN

The 0.75 per cent pectin solution has been used exclusively in the prevention and treatment of shock, traumatic or surgical. In other words, it has been used strictly as a replacement fluid when blood or plasma transfusions would otherwise have been indicated.

For patients the size and speed of the infusions must be given careful consideration, and experience has shown that 5 to 10 cc a minute can be maintained in the average patient without subjective symptoms. As with cold bank blood pectin solution may be given faster if the situation demands it, 1,600 cc is the largest amount given continuously.

Chart 5 (patient B. B., aged 32)—Diagnosis marginal jejunal ulcer operation, release gastroenterostomy, partial gastrectomy, postoperative course uneventful

If given slowly to normal individuals, the blood pressure, both systolic and diastolic, tends to increase. Plasma volumes in normal individuals are reported by

6 Whipple G. H., Smith H. P., and Belt A. E. Shock as a Manifestation of Tissue Injury Following Rapid Plasma Protein Depletion. The Stabilizing Value of Plasma Proteins, *Am J Physiol* 53: 72 (May) 1920

Jacobson and Smyth,⁷ who used the Evans blue dye method. These authors show not only that the pectin solution infused is retained in the circulation for from four to five hours but that an additional amount equivalent to 7 to 10 per cent of the original plasma volume may be drawn in from the tissues. After twenty-four hours 3 of 7 individuals still showed plasma volumes above the original of 13 per cent, 21 per cent and 27 per cent (charts 2 and 3). In contrast, saline infusions showed rapid loss of the saline from the circulation with plasma volume levels reaching near normal. This occurred despite the fact that the amounts of saline infused averaged 40 per cent higher than the amounts of pectin solution (chart 4).

Clinically more than 125 surgical patients have received pectin solutions. The distribution of these is represented in table 6. The need for infusion is suggested by the type of cases and the length of the

operative procedures (table 7). The response is shown in chart 5 and table 8. In some of the cases blood or plasma was given either before or after the pectin, and no signs of incompatibility were observed. The results indicated as good refer to a satisfactory response in blood pressure and general condition. A fair result indicates stabilization of blood pressure or a moderate increase, while the poor results obtained in 5 per cent indicate no increase or slight decrease in blood pressure, so that other measures were made necessary.

Very few patients in postoperative shock were seen, but those treated showed satisfactory improvement (chart 6).

Traumatic shock is unusual in our institution but the results in the limited number of patients treated with pectin are encouraging.

SUMMARY AND CONCLUSIONS

1. Pectin furnishes a readily available source for colloidal solutions which may be prepared economically.

7 Jacobson S. D. and Smyth C. J. Plasma Volume Changes Following the Intravenous Injection of Pectin and Physiological Saline in Man. *Proc Soc Exper Biol & Med* 50: 218 (May) 1942

2 The pectin molecule contains no protein and the solutions give few if any reactions if the method of preparation is correct

3 Solutions prepared by multiple filtration and heating for fifteen to eighteen hours are preferred

4 Good solutions should be water clear. They should have a viscosity of from 2 to 4 at 38°C and osmotic

Chart 6 (patient M M.)—Operation radical mastectomy surgical shock duration one hour forty minutes

pressure from 45 to 70 mm of mercury, depending on the percentage of pectin 0.75 to 1.5. The molecular weight may vary from 60,000 to 75,000.

5 In animals the solutions as described are well tolerated and are more efficient in replacing blood loss than electrolyte solutions.

6 In human patients intravenous injection tends to increase both the systolic and diastolic blood pressure.

7 Blood volume is increased and well maintained by pectin solutions administered intravenously.

Chart 7—Patient P P was struck by a hit and run driver and admitted to the emergency room at 2:30 a.m. on Jan 1, 1943. Condition at that time was obviously critical. Patient was cold, pale and obviously deeply shocked. Blood pressure was almost unobtainable being approximately 40/0. Pulse was thready and about 170 per minute. Pectin was started almost immediately after admission to the emergency room because plasma was not immediately obtainable. Arrow at A shows when administration of 1000 cc of pectin and 500 cc of saline solution was completed. Examination showed fracture of the pelvis compound fracture of the right tibia and fibula distention of the bladder severe laceration of the head and probable skull fracture. After about 400 cc of pectin condition was improved with blood pressure 70/30 pulse 120 per minute and stronger. Pectin 1400 cc was given with gradual improvement.

8 These solutions have been used in 125 clinical cases as a substitute for electrolyte solutions, blood and blood plasma in the prevention and treatment of shock with satisfactory results.

ABSTRACT OF DISCUSSION

DR VIRGIL H. MOON, Philadelphia: I have been following with interest the work of Dr. Hartman and his associates on pectin as a possible blood substitute in the treatment of shock. It has been stated by eminent physiologists that the usefulness of a fluid in the treatment of shock depends more on its physical than on its biologic properties. Therefore if one could find a fluid which has a viscosity approaching that of the blood plasma, a molecular weight not too far from that of plasma and particularly a colloidal osmotic pressure which is somewhere near that of the blood plasma and if that substance is not antigenic and produces no obvious effects, it would be an ideal substance for use as a blood substitute. It appears that pectin as prepared and used by the authors conforms to those specifications very closely. The fact that they have used it not only in experimental animals but in human beings in numerous instances with satisfactory results indicates that it may be a useful substitute for plasma or serum when the latter substances are not obtainable. Obviously, if plasma or serum is at hand, I think that even the authors would prefer to use it, because it replenishes the plasma proteins with the same type of protein which was lost. This property, of course, is lacking in a vegetable product such as pectin. Few of those who have written concerning shock realize that one major item in its dynamics is a disturbance of fluid balance. This results from injury or damage to the endothelial membrane. Many forces are concerned with the passage of fluid from the blood to the tissues and vice versa, but the operation of those forces is absolutely conditioned on the presence of a normal semipermeable endothelium between those two areas. Anything that damages endothelium renders it more permeable and interferes seriously with osmosis, which is a major factor governing the movement of fluid between the blood and the tissues. In shock there is a sharp disturbance of fluid balance, and an abnormal shift of fluid from the blood to the tissues occurs. In some of the cases reported by the authors there was a sustained increase in the blood volume. This indicated that fluid balance had been reestablished, at least in part. If this occurs regularly or frequently it would indicate that pectin solution may be useful in more than one way. Not only does it restore the fluid loss but it may tend also to restore fluid balance.

DR HARRY J. CORPER, Denver: Some years ago we worked in our laboratories with pectin and were able to obtain a dry pectin preparation on the market, but it proved unsatisfactory. Dr. Hartman did not mention the type of pectin referred to or whether dry pectin would prove suitable for preparing desirable solutions.

DR F. W. HARTMAN, Detroit: We have repeated the blood volume studies using Evans blue dye in dogs and have found evidence of definite differences in the reaction of the dog when Evans blue dye is used or when pectin is used in the presence of the Evans blue dye. We do not know why that is, however, it does seem that there is the possibility of a combination between this azo dye and the colloid of pectin. I think we had better sound a warning against the combination of pectin with a lot of other things, particularly with dyes and metals which may form a combination. We have used this material in 135 clinical cases alone and we have never seen any such manifestations and we have never seen any untoward reactions. I have been asked many times whether one could give this or that with pectin, and my answer has been that I do not know, but the three instances, that is, the combination with the azo, the combination with bismuth and the combination with arsenic, would indicate that if it is to be used it should be used alone and not in combination with these other substances. We are using the purest material which is recognized by the National Formulary and which is known technically by the name of pectin. The specifications are very carefully worked out. In Dr. Moon's comments, I think his interpretation of the presentation is entirely correct. In none of these patients was there volume loss at the end of four hours. In fact, the average was 23 per cent above the beginning dose, the amount administered initially. If we should find that this material is somewhat more effective in supporting the blood volume and the blood pressure

than biologic products such as plasma or blood, I do not believe we would hesitate to use this in preference, because there is no incompatibility between this material and the blood or the plasma. In other words, one could give blood before or after administration without any evidence of reaction or incompatibility. In our institution we are using pectin routinely in all major surgical cases, the same way as we previously used blood or plasma during the operative period. As to the food value, this material is exerted as such, so there is no food value in it but we have found that a biologic product, that is, a solution of amino acids, can be combined with this material safely and that the combination is well tolerated and that in animals, at least, it does rapidly build up the plasma protein, so that such a combination may be considered and, if proved satisfactory in human use, it may do practically everything that blood plasma will do.

Clinical Notes, Suggestions and New Instruments

A CASE OF CORONARY OCCLUSION FOLLOWED BY PREGNANCY WITH SUCCESSFUL TERMINATION

OSWALD HORWITZ, MD LOUIS B. LALPHEE, MD, NORMA P. SHAWWAY, MD AND WILLIAM D. STROUD, MD
PHILADELPHIA

It has been thought and expounded in recent years not only that coronary occlusion occurs in younger people but also that the prognosis which at one time was regarded as invariably extremely grave by Heberden and his followers, may now be considered somewhat better. Cases have been reported recently of coronary disease occurring in younger people such as the

apparently in complete recovery, the patient now leading a more or less unrestricted life.

Master, Dick and Jaffe report that 202 patients who had acute coronary disease proved by electrocardiographic evidence all recovered one third being able to live a life with either slight restrictions or none at all. Jaffe³ also reports that patients who had their acute attacks as far back as 1925 have led useful lives with more or less unrestricted activity. However in these reports we have been unable to find an instance in which such a patient was able to go through a normal pregnancy. It is for this reason that we are reporting this case.

Fig. 2—Appearance of chest about Aug 10, 1942.

HISTORY OF CASE

M. B., a white woman aged 35 entered the office of one of us (N. P. S.) in September 1940 complaining of pain in both ankles and swelling of the left leg. She stated that she had been suffering from sinusitis since 1937 and had had slight dyspnea on exertion. She had never been pregnant. In 1938 she had her appendix and right salivary removed. The operation was complicated by phlebitis of the left leg.

The patient was thin, nervous and moderately well nourished but of rather poor musculature. The hands and feet were quite cold with mottling of the skin. There was slight tenderness over both axillary sinuses. The tonsils had been removed. The heart was not enlarged and the sounds were normal. There was a soft apical systolic murmur which was thought to be of no pathologic significance. The blood pressure was 130 mm. of mercury systolic, 78 diastolic. There was slight edema of the left leg but no evidence of arthritis. The impression at that time was that the patient was probably suffering from vasomotor instability and psychasthenia.

On Dec. 29, 1940 the patient was seen at 11 p. m. during an attack of severe substernal pain which required morphine for relief. The pain continued for about thirty six hours and then moderated in intensity. An electrocardiogram was taken two days later and is seen in figure 1. She was kept in bed for approximately two months and then allowed progressive increased activity, which was finally almost unrestricted. Serial electrocardiograms were taken which suggested healing of the myocardial infarction.

On Sept. 6, 1941 she was seen by Dr. Louis Lalphee, who found no convincing evidence of heart disease and assured the patient that her heart was then organically sound.

In December 1941 she consulted Dr. Robert A. Kimbrough who found that she was two months pregnant. It was decided at this time that she should go through with the pregnancy, and it was felt that the outcome would be satisfactory. Orthodigrams and electrocardiograms taken during her pregnancy were well within normal limits and were featured only by some degree of left axis deviation. On July 25, 1942 she was delivered by cesarean section of a healthy 6½ pound (3,060 Gm.) boy by Dr. Kimbrough, two weeks after which another electrocardiogram and a fluorocentigram were taken. The latter was completely negative as may be seen in figure 2 and the electrocardiogram showed slight left axis deviation but was otherwise entirely within normal limits.

In some ways this case is similar to the case report by Barnes and Burchell⁴ of acute pericarditis which simulates coronary disease from the point of view both of symptoms

Fig. 1—A tracings taken Dec. 31, 1940. Rhythm normal. Rate 86. PR interval 0.17 second. No axis deviation. Inverted. Chest lead. P wave deeply inverted. ST segment elevated slightly. QRS notched. In view of the history this was considered typical of a recent anterior myocardial infarction. B tracings of Jan. 15, 1941. Rhythm normal. Rate 75. PR interval 0.17 second. No axis deviation. Inverted. Chest lead. T wave biphasic. It was believed that there was considerable improvement since tracings of Dec. 31, 1940. C tracings of Sept. 5, 1941. Rhythm normal. Rate 88. PR interval 0.18 second. Slight left axis deviation. In low amplitude. Chest lead normal. This shows remarkable improvement of the record of Dec. 31, 1940. D tracings of Aug. 5, 1942. Aside from the tachycardia of 108 and the mild degree of left axis deviation these tracings are within the limits of normal.

case reported by Ravdin and Wood,⁵ in which the coronary thrombosis was complicated by an embolus to the bifurcation of the aorta and which necessitated an embolectomy and resulted

SCIATIC NERVE INJURY DUE TO THE INTRA-MUSCULAR INJECTION OF PARALDEHYDE

FREDERICK C. WOODSON, M.D., Boston

Assistant in Neurology, Harvard Medical School, and Resident in Neurology, Boston City Hospital

Direct injury to peripheral nerve trunks by deep intramuscular injection of drugs has been reported by many observers. Oppenheim¹ in his *Textbook of Nervous Diseases* states that paralysis of the sciatic has been produced by the subcutaneous injections of ether, sublimate and antipyrine, and by the alcohol injections which were once used in the treatment of sciatica. Biggam² and Seshachalam³ have found nerve damage due to quinine injection, and Gammel⁴ reported a case of peroneal nerve palsy after bismuth injection in the treatment of syphilis. Recently Elkington⁵ reported 2 cases of sciatic and one of radial nerve paralysis developing within a few days after deep injection of sodium sulpyridine.

To my knowledge there has not been any reported case of injury to the sciatic nerve by paraldehyde. It is my purpose in this report to record 3 cases occurring within a brief period of time in which damage to this nerve followed the intragluteal injection of paraldehyde.

Cervello is reported by Goodman and Gilman⁶ to have first used paraldehyde in 1882. It soon became recognized as a drug of low toxicity permitting a wide range of safety. The intravenous route of administration was initiated in 1912 by Noel and Souttar.⁷ In 1934 Johnson⁸ reported 20 cases in which the intramuscular route was used with impunity. During recent years the latter method has been widely adopted, although occasional tissue necrosis may develop.

REPORT OF CASES

The following 3 cases were referred to the Neurological Service of the Boston City Hospital on account of symptoms referable to the sciatic nerve.

CASE 1—M. T., a man aged 34, a factory inspector, had an acute illness characterized by sore throat, headache, chills, malaise, vomiting, delirium and, finally, coma. On examination the patient was comatose. The neck was rigid, Kernig and Brudzinski signs were present. The deep tendon reflexes were hyperactive and the plantar responses were of the extensor type. There was a maculopapular rash over the trunk and extremities, and a few moist rales were heard in the right lung base.

There was a leukocytosis of 22,100 cells, with 88 per cent polymorphonuclear leukocytes. Urinalysis was normal except for the presence of occasional pus cells. The spinal fluid was turbid, was under a pressure of 340 mm of water, and contained 30,000 leukocytes (100 per cent polymorphonuclear) and

gram-negative diplococci. Chemical examination revealed protein 366 mg, sugar 7 mg and chloride 629 mg. The blood and spinal fluid Hinton reactions were negative.

A diagnosis of meningococcic meningitis was made and treatment with sulfathiazole and sulfadiazine, orally, was instituted. A total of 5 Gm of sulfathiazole and 90 Gm of sulfadiazine was received by the patient during the ensuing fourteen days. After four days the patient became conscious but was excited and behaved in an irrational manner. During the next few days several injections of paraldehyde were administered intragluteally, practically all into the right buttock. On the eighth day after commencement of treatment the patient was allowed up in a chair and at that time he complained of weakness of the right leg and intense pain in the posterior aspect of the right thigh.

He was referred to the Neurological Service on the fifteenth day. On examination at that time there was considerable weakness and atrophy of the right thigh and leg. All movements of the thigh, leg and foot were weak, although no single movement was completely lost. A partial foot drop was present. The right achilles reflex was diminished. The patellar reflexes were equal and the plantar responses were flexor. Straight leg raising and pressure along the course of the right sciatic nerve produced severe pain. Sensation of numbness was felt along the lateral surface of the foot and little toe. Appreciation of touch, pain and temperature was decreased on the posterior aspect of the calf and ankle. A small oval area of anesthesia and analgesia was found on the upper part of the calf and another such area on the buttock. The posterior surface of the thigh was decidedly hyperesthetic and hyperalgesic, the highest touch causing intense pain. Position and vibratory sensations were not affected.

The spinal fluid which was examined on the nineteenth day was under a pressure of 90 mm of water and contained 11 cells and 20 mg of protein.

Treatment of the affected limb with rest, diathermy and the heat cradle was instituted. The hyperesthetic area slowly decreased in size but did not entirely disappear. The right achilles reflex was eventually lost. The patient became more comfortable but on the day of discharge, forty-eight days after symptoms referable to the leg developed, there remained pronounced wasting and weakness of the leg and only slight return of sensation.

CASE 2—F. J., a man aged 42, a mail carrier, developed hematemesis following prolonged ingestion of alcohol. On admission to the hospital the patient was intoxicated, with apprehensive facies and gross tremors of the extremities. There was a patch of old choroiditis in the right optic fundus. The tongue was smooth and red and the teeth were carious. The heart and lungs were normal and slight tenderness was present in the epigastrium. Blood and urine studies were normal and the blood Hinton reaction was negative.

Owing to his extreme restlessness the patient was given paraldehyde rectally. When this proved ineffectual, he was given 20 cc of the drug into the lower half of the left buttock. Immediately a sharp pain shot down the posterolateral aspect of the left leg to the dorsum of the foot. Within two minutes the dorsum of the foot became blue and swollen and numbness enveloped the thigh and leg. Sleep occurred shortly afterward.

On the following morning the patient was referred to the Neurological Service. At that time he complained of throbbing in the great toe and numbness from the mid thigh to the foot. The left foot was discolored, edematous and tender on the dorsal surface. The site of needle puncture was evident in the lower half of the left buttock near the midline. All movements of the left foot were impaired, and foot drop was nearly complete. Movements at the hip and knee were not weakened. The patellar reflexes were equal, but the left achilles reflex was absent. The plantar responses were flexor. On palpation the left foot felt warmer than the right and the left calf was tender to compression and the muscles were lacking in tone. Pain, temperature and tactile appreciation were lost in a well defined area covering most of the dorsum of the foot and the posterolateral surface of the leg. The border of this area and part of the dorsum of the foot were hyperalgesic. A

less definite area of hyperalgesia extended up over the popliteal space and posterior surface of the thigh. Position sense was lost in the left foot, and vibration sense was diminished below the knee. Stimulation with the faradic current produced no response in the extensors of the foot and a weak response in the extensors of the toes. A sweat test brought no response on the dorsum of the foot. Permission to examine the cerebrospinal fluid was refused.

During his stay in the hospital the patient complained of sharp stabbing pains in the calf, foot and toes, often without stimulus. The swelling of the foot eventually subsided. Treatment of the involved extremity consisted of physical therapy and the application of a foot brace. On discharge from the hospital on the thirty-first day, the patient was more comfortable but there was little or no improvement in muscular strength or in the sensory defect.

CASE 3—P. P., a man aged 42, a seaman, was treated for intoxication resulting from excessive alcohol ingestion of three weeks' duration. On examination, in addition to the signs of intoxication there were gross tremors of the tongue and extremities and a chronic purulent otitis media on the left side. The heart, lungs and abdomen were normal. Reflexes were normally active. Laboratory studies of the blood and urine were normal.

On account of restlessness the patient was given 12 cc of paraldehyde into the upper outer quadrant of the right buttock. No immediate symptoms were experienced. On the following morning he complained of numbness of the entire right leg from the buttock and groin to the sole of the foot, the sensation being most pronounced along the posterior aspect. No pain was felt in the leg. The patient stated that the foot and ankle were weak.

When he was referred to the Neurological Service on the third day there was weakness of all movements of the right foot, especially dorsiflexion, and slight weakness in flexion of the leg at the knee. The right achilles reflex was absent. Patellar reflexes were equal and the plantar responses were flexor. A large oval area of anesthesia and analgesia was found over the posterior aspect of the right thigh and lower part of the buttock. A similar area of sensory loss, less sharply defined, was present over the heel, toes and medial surface of the foot. Position and vibratory sensations were preserved. The point of the needle entry was not visible. The spinal fluid was entirely normal.

The patient left the hospital on the fifth day. He declared that the sensation and strength were improved in the affected limb, but no change was evident on objective examination.

COMMENT

In case 2 the immediate development of symptoms suggests that the drug was injected directly into the nerve sheath. It was apparent that the injection was made too near the gluteal fold and that an unusually large quantity of paraldehyde was introduced. In case 1 it was impossible to determine whether one or several injections led to the nerve palsy, since multiple injections were given, all into the same general region. In the third case 12 cc of the drug was supposedly given into the upper outer quadrant of the buttock, the accepted site for intramuscular injections. It is assumed that the course of the needle was misdirected after the skin was pierced or that the paraldehyde was later displaced toward the sciatic nerve.

In 2 of the cases pain and weakness were the outstanding symptoms and in 1 numbness and weakness occurred. In all 3 cases there was little evidence of recovery after varying periods of time.

The question may naturally arise as to whether the symptoms should be attributed to some other factor than paraldehyde. In case 1 the possibility that the nerve injury was a complication of meningitis or due to the toxic influence of the sulfonamide drugs has to be considered. In the other 2 cases hospitalization was due to chronic alcoholism, a condition often associated with peripheral nerve involvement. However, the isolated nature of the paralysis and its development in each case within a brief interval after injection of paraldehyde into the region of the sciatic nerve trunk indicate a direct causal relationship.

SUMMARY AND CONCLUSIONS

Injury to peripheral nerves has followed the intramuscular injection of various substances into or near the nerve trunks. Among the irritants previously reported are bismuth, ether, alcohol, gumme, antipyrine and sodium sulfapyridine. To this group are added 3 cases of sciatic nerve injury following the intragluteal injection of paraldehyde.

Paraldehyde is an irritant, and its parenteral use may cause injury to nerves with which it comes into contact. The increasing use of this method of administration may be expected to lead to additional mishaps such as those herein reported unless particular care is taken. The oral or rectal route should be used in preference to the intramuscular. When the latter method becomes necessary the drug should be injected at a safe distance from important nerve trunks, and not more than 5 cc should be given in one injection.

ACNE CONGLOBATA AND PERIANAL PYODERMA (HIDRADENITIS SUPPURATIVA)

PROMPT RESPONSE TO LOW FAT DIET AND THYROID THERAPY

RICHARD I. SUTTON, JR., M.D., AND MARK M. MARKS, M.D.
KANSAS CITY, MO.

Acne conglobata is a chronic inflammatory disease of the skin which is characterized¹ by the presence of the constituents of acne vulgaris, such as comedones, papules and pustules, and in addition large elevated, fluctuating plaques which are dusky blue and frequently form cutaneous or subcutaneous abscesses and oil cysts, which may perforate and form discharging sinuses, healing very slowly and often leaving keloidal or so called bridge scars (brückenarben) of Lang. The lesions closely resemble tuberculodermas of the colligative type (scrof-

FIG. 1—A, buttocks and perianal region before operation; B, showing sluggish wounds one week after operation.

ulodermis). Ormsby² credited Reimann with the first description of the disease, in 1908, occurring in 4 men who had "innumerable comedones, many double comedones and comedo scars together with follicular and perifollicular inflammatory infiltrations, often confluent, some of which had softened and were open."

Pautrier described a case in which torpid abscesses, keloid fibrous bridges and other hyperplastic fibrous formations occurred in the early stages in the usual acne areas. Later indolent abscesses developed on the hips and buttocks and these were followed with lesions resembling bromoderma or blastomycosis on the arms, forearms and thighs.

The chronicity of this rare form of severe acne and its rebelliousness to treatment are well known to dermatologists.

Proctologists see cases such as those described by Highman³ in which the perineum and buttocks are riddled with abscesses. One of us (M. M. M.) has in the past seven years undertaken to manage the disease severely affecting the buttocks of 10 Negro women aged 25 to 50. Each suffered from hypoglandular defects as evidenced by obesity and schorria as well as ordinary acne affecting other parts of the body. Their "perianal pyoderma" was treated with surgery, heliotherapy and vaccines without success. Postoperative healing was exceedingly slow and ended with keloidal scars. Smith^{3a} described 6 cases of perianal pyoderma of the type here considered. Relationship of

this to hidradenitis suppurativa,^{3b} a disease which affects mainly the axilla as a rule was recognized by Jackman.⁴ The venous nature of one type of hidradenitis, the type not due simply to staphylococcal parasitism of axillary sweat glands, was postulated by one of us (R I S Jr).^{3d} The groin location of lesions of hidradenitis suppurativa was depicted by Brunsting^{3c} in a case which we would class with the venous type and which resembled the case we report. We believe such cases not to be of pyogenic bacterial etiology. We consider them and perianal proctoderma and acne conglobata, all to be variants of acne.

Pain in the sitting position was the complaint of our patient, whose acne conglobata had existed for thirteen years. On July 6, 1942 he underwent an operation for the drainage of sinus tracts about the anus. The resulting wounds were painful, sluggish and unresponsive to treatment. A few days later his cutaneous lesions were recognized as acne conglobata and he was put on the treatment one of us⁴ devised and routinely uses in the management of acne vulgaris, a treatment based on the hypothesis that the lesions of acne are inflammatory

within a few weeks until they themselves have tried this method of treatment in cases in which they have not been able to afford much relief over a period of years. We hope too that proctologists may be enabled to manage successfully cases which have puzzled and disappointed them in the past.

REPORT OF CASE

G W, a white man aged 32, an electrician, complained of pain in the sitting position, perianal abscesses, sores on the skin and weariness. Since 1929 his acneform troubles had been severe and marked by the development, healing and recrudescence of symmetrically located plaques of boggy, painful, sinus riddled dermatitis from which oozed thin malodorous pus and which in healing left keloid-like, irregular, rough cribriform and atrophic scars. Lesions were located on the back of the neck over the scapulas, over the sternum, about the buttocks and perianal region, in the groins and on the forearms. While the patient was seldom completely incapacitated, he was continually in pain, forced to wear dressings and often obliged

Fig 2—A left inguinal lesion before treatment showing edema and comedones B left inguinal lesion after seven weeks of treatment with low fat diet and thyroid showing healthy scars and absence of edema and comedones C, left forearm lesion before treatment showing edema and comedones D left forearm lesion after seven weeks of treatment showing healthy scars and absence of edema and comedones

foreign body reactions to lipid. On a low fat diet and thyroid medication the wounds began promptly to heal, losing their painfulness. By August 31, only seven weeks later, he was completely relieved of all symptoms in all parts of the body, only scars remained. He stated that he "did not know it was possible to feel so good."

We report our case in the expectation that dermatologists will be skeptical of our claim to have cured acne conglobata.

to undergo procedures of incision and drainage, the wounds from which granulated tediously and generally broke down after apparent healing. He had despaired of ever feeling better.

The patient had previously sought medical care in a number of cities. In particular from 1938 to 1941 he regularly attended a clinic in New Orleans, where investigations were intensively pursued during six weeks of hospitalization in 1941. Such local, vaccinal and roentgen therapeutic efforts as were tried failed. Tuberculosis was not demonstrated.

The feature of weariness was noteworthy throughout the past nine years. No amount of sleep provided a sense of satiety with rest. The patient for many years drank 3 quarts or more of milk a day, hoping thereby to improve his condition. Much of the time he had a low grade fever, probably because of secondary infection and absorption of purulent material.

When we saw him, both buttocks were scarred. The skin and subcutaneous tissues of that region supported linear indurations, thick, bluish and pierced in many places by openings from which rancid pus and caseous matter could be expressed

(fig 1A) There was no fistulous connection with the anal canal. At operation on July 6, 1942 the sinus riddled inflammatory tissue about the anus was excised or widely opened. Pain and reluctance to heal featured the first postoperative week (fig 1B).

We directed him on July 11 to follow a low fat diet, without limit as to caloric content, and to take thyroid U S P in a dose of one 1 grain (0.065 Gm) tablet twice a day with breakfast and supper. He was instructed to record daily his basal temperature, the temperature in the morning before arising from bed. This is a guide on which we have learned to rely after having tested it, in comparison with basal metabolic rate determinations as a criterion of thyroid function, at the suggestion of Dr Broda Barnes. On July 14, after taking 2 grains (0.13 Gm) of thyroid U S P a day for three days, his basal temperature was 97.8 F, the weight was 148 pounds (67 Kg) and little change was as yet observable in his condition. Photographs (fig 2A and C) were taken which show the edematous state of the boggy lesions and many comedones in the irregular interstices of their corded surfaces. On July 17 he felt brighter, more vigorous and less tired by his day's work; the lesions, including the operative wounds, were drying, healing and less painful, the basal temperature remained at 97.8 F and the weight was 149 pounds (67.6 Kg). He was instructed to take 3 grains (0.2 Gm) of thyroid each day. On July 20 he weighed 150 pounds (68 Kg), the basal temperature was 98 F, and he had mild irritable symptoms of thyroid overdosage. He was ordered to omit the next two 1 grain doses and then to continue on 2 grains a day. The lesions showed continuation of their tendency to heal and their soreness was leaving. The patient made an unexpected trip out of town and forgot to carry his thyroid tablets with him. After a week without thyroid medication he felt so bad and the lesions were so apparently getting worse that he prevailed on a village druggist to give him thyroid tablets without a prescription for them. He then took 2 grains a day until his return to Kansas City on August 10. The operative wounds were now completely healed. He weighed 150 pounds and his cutaneous lesions were almost free from discharge, but the basal temperature had dropped to 96.8 F. He was ordered to take 3 grains a day, although three weeks previously this had been an overdose. Now, however, he tolerated 3 grains a day and, in fact, was by this time so familiar with the effects of thyroid and with our intention of raising his temperature to normal that he increased the dose of his own accord. On August 22 he telephoned the report that his basal temperature stayed at 98 F on a dosage of 3½ grains (0.22 Gm) a day. On August 31 his weight was 152 pounds (69 Kg), and there after on 4 grains (0.26 Gm) a day his temperature remained normal at 98 F. By August 31 every lesion was dry, firm, painless and free from edematous inflammation and comedones had dropped away, as seen in photographs (fig 2B and D) taken on that date. He was working fourteen hours a day, sleeping soundly and awaking refreshed. There was no symptom of thyroid overdosage. Objective evidence of his declared sense of well-being was apparent. He had gained 4 pounds (1.81 Gm) in seven weeks while taking thyroid. When last seen in February 1943 his condition had remained excellent and his thyroid dose continued to be 3 grains (0.2 Gm) a day.

COMMENT

To dermatologists, the only physicians who as a class are familiar with acne conglobata, such a case record of definitive response to apparently specific therapy is astonishing. To proctologists, familiar with perianal pyoderma, the same is true. In fifty days a man with an illness of ten years' duration was relieved of all manifestations saving scars and felt a sense of well-being such as he had never known. Improvement was observable within two weeks of the start of his regimen. If he had not been away from control for three weeks, we believe that the fifty days would have been reduced to perhaps thirty-five.

We believe that such results can be repeated in every case of acne conglobata. The necessary conditions are, we think, the maintenance of (1) a truly low fat diet⁵ which does not

entail curtailment of any nutritional necessity⁷ and (2) a dose of thyroid which is the maximum amount tolerated without any symptom of overdosage. The basal temperature⁸ was a valuable criterion of the proper dosage in this case, as we find it also in the treatment of acne vulgaris.

As to the patient's intolerance of 3 grains of thyroid a day nine days after treatment was started, followed by tolerance of 4 grains a day five weeks later, we think that early in his course he was febrile from absorption of exudate which was then still profuse, whereas later the basal temperature fell below 97 F because the lesions had almost healed, so that no absorption occurred. Then the larger dose of thyroid was tolerated and necessary.

Looking briefly at the literature on acne conglobata, one finds Wise⁹ saying "The actual etiologic factor is unknown; however, the fact remains that the condition occurs in a person with a seborrheic skin, which in this instance constitutes a soil particularly susceptible to the formation of abscesses and scars." Fraser¹⁰ spoke of the "special predisposition." Crutchfield¹¹ observed that even in large abscesses one finds no organisms and that tuberculosis cannot be demonstrated. Michelson and Allen¹² helped their patient with cleanliness, sulfur baths and a vaccine given intravenously. Highman¹³ helped his with a blood transfusion and liver extract. Belote¹⁴ concluded that "tuberculosis as a specific etiologic factor can be excluded."

The condition apparently is not caused by a specific organism. The etiologic factor of importance apparently is the patient himself and involves a constitutional "predisposition." In experiments on 2 patients with acne conglobata, Belote inoculated 1 with pus from the other and so provoked a fairly typical lesion. We interpret this as a successful transference of oily matter which acted as a foreign body¹⁵ in the second patient, just as it did in the first. Pautrier¹⁶ believes the etiology must be sought in a study of the terrain.

Gent¹⁷ thought that "no results can be expected from antovaccines, stimulation or fever therapy, but immediate cessation of nodule formation and of suppuration is observed after internal use of Fowler's solution, after the usual method combined with prolonged sulfur baths and external application of liquor caleni sulfurati, which must be rubbed into the skin with a handbrush." We should not have tried the handbrush on our patient without a general anesthetic.

We believe that the peculiarities of the terrain lies in conditions conducive to hypothyroidism and improper lipid metabolism. Our patient was managed with striking success.

⁷ Low fat diet instructions. The living body requires a certain number of calories. If the food eaten does not contain the requirement, then the remainder is obtained by using up the body's store of fat and the individual loses weight by burning oil. Therefore, when one loses weight one is not on a low fat diet. So if one faces the alternative of either eating fatty food or else going hungry one should eat. In general foods of plant origin are low in oil content and foods of animal origin are high in oil content. There is no limit on quantity of food eaten.

Avoid These Fatty Foods	Lat These Nonfatty Foods
Milk—none to drink	Cereals (hot or cold), wheat bread
Cream	Fruits (apple, pear, banana and others)
Butter	Vegetables (potato, rice, tapioca, corn, hominy, all kinds of beans, peas, cauliflower, cabbage, turnip, lettuce, celery, onion, cucumber, pickle and others)
Ice cream—none	Sugar, jam, jelly, honey, syrup
Cheese (cottage cheese is all right)	Sugar candy (stick candy, gum drops, jelly beans, caramel, laff, divinity)
Pork, ham, bacon, sausage	I can meats (beef, veal, chicken), all sea foods, all game, fishes, frog's legs, gelatin, white of egg
Wieners	visceral organs such as liver, kidney, sweetbread
Gravy	Salt, pepper, spices
Fried foods	Beverages except milk, chocolate, alcohol, tomato juice, grape juice
Nuts, peanut butter	
Chocolates, cocoa	
Vegetable oils (crisco, corn oil, olive oil, margarine)	

Avoid also certain rich sources of the lipid, provitamin A like such sources: tomato juice, catchup, chili, cod liver oil and vitamin concentrates: spinach, carrot, sweet potato and yolk of egg.

without regard to cleanliness or local applications. His major dietary change by our order was the elimination of milk, 50 to 60 per cent of the caloric value of which comes from fat.

SUMMARY

A patient with acne conglobata and perioral pyoderma of many years' duration responded, with strikingly prompt and satisfactory results to treatment with a low fat diet and thyroid given to tolerance. Acne conglobata perioral pyoderma and hidradenitis suppurativa of the acneic type comprise various manifestations of one disease, acne, which is fundamentally a disease of lipid metabolism.

THE STANDARDIZATION OF ELECTROCARDIOGRAPHIC NOMENCLATURE

REPORT OF COMMITTEE OF THE AMERICAN
HEART ASSOCIATION

ARLIF R. BARNES, M.D., ROCHESTER, MINN., LOUIS N. KATZ, M.D., CHICAGO, SAMUEL A. LEVINE, M.D., BOSTON, HAROLD F. B. PARDEE, M.D., NEW YORK, PAUL D. WHITE, M.D., BOSTON, AND FRANK N. WILSON, M.D., ANN ARBOR, MICH.

It is nearly half a century since Einthoven first employed the letters P, Q, R, S and T to designate the component deflections of the curves which he obtained by computing and eliminating the distortion present in records of the normal heart beat taken with the capillary electrometer. After he had invented the string galvanometer and was able to record the human electrocardiogram in undistorted form he continued to use these symbols and eventually added to their number by assigning the letter U to the low voltage deflection often present in early diastole and by accepting the designation T_a , previously employed by Hering for the inconspicuous final component of the ventricular complex.

This system of nomenclature has been in practically universal use since the very beginning, and it is permanently embedded in a vast and important literature, which all serious students of electrocardiography must frequently consult. In spite of the tremendous growth of this science in the recent past, it has continued to serve its purpose more than reasonably well. Some have found it unsatisfactory in certain respects and have tried to replace it with an entirely different terminology, but such efforts have met with no success and are now of interest chiefly from the historical standpoint. Under these circumstances it seems essential that, in attempting to standardize electrocardiographic nomenclature, we respect usages that are long standing and generally accepted and make only such recommendations as may be required to meet urgent needs of the present and immediate future. It is desired that all concerned clearly understand the causes of dissatisfaction which have led to a demand for some action of this sort.

Much of this dissatisfaction is clearly dependent on the circumstance that electrocardiographic nomenclature, like any other language, is continuously changing. It must grow and expand with the science which it serves and can be stabilized only temporarily. With the advance of knowledge the terms and symbols introduced by our predecessors have been utilized to meet new needs and have acquired meanings which they did not originally possess and which are not exactly the same for all workers. We propose to redefine those terms that are in general use, so that misunderstanding

may be avoided. The introduction or recommendation of new terms which have not been widely adopted in response to an imperative need would be more confusing than helpful.

It was primarily to facilitate the description and discussion of the form of the electrocardiogram that Einthoven first assigned letters to its individual components. It is important that this function of our nomenclature should be kept in mind. The deflections to which he gave names differed one from another in various ways—in size, in direction, in shape, in duration, in sequential position and in their relations to other events in the cardiac cycle. All the components originally named were no doubt regarded as fundamentally different in origin. It should be emphasized that neither the observed differences nor the differences in origin inferred can be considered all of the same sort or all equally significant.

It is clearly desirable that deflections alike in origin always be given the same name and that deflections unlike in origin bear different names. Both Einthoven and Lewis after him recognized the validity and importance of this principle. The former went considerably further than the latter in his efforts to avoid violating it and his writings suggest that it was chiefly for this reason that he never solved to his own complete satisfaction the problem of adapting his nomenclature to electrocardiograms of unusual or abnormal outline. The difficulty seems to have been that he did not fully realize that the symbols he was using differed greatly in value that the phenomena which they represented were by no means equal in rank.

When dealing with initial ventricular deflections conspicuously different from those to which the letters Q, R and S were first assigned, he usually did not attempt to name them individually but made use of the symbol QRS to designate this group of deflections as a whole. This solution of the problem surrendered the advantages which he had gained originally by naming the components of the QRS complex.

In the case of bundle branch block of the common type he went further still and often labeled the first large deflection of the essentially diphasic ventricular complex A and the large final deflection B . For a similar reason Lewis assigned the symbols Q' , R' , S' and T' to the components of electrocardiograms of this kind. Few authors have followed Einthoven and Lewis in giving distinctive names to the ventricular deflections of branch block curves. According to our present conceptions the final ventricular deflection always represents the same physiochemical process. By always calling it the T wave we emphasize this important truth. By giving it one name when normal and a variety of others when abnormal we should obscure a likeness which is fundamental for the sake of making distinctions which are, by comparison, trivial. These remarks apply with equal force to the problem presented by normal and abnormal QRS complexes.

In cases of pronounced axis deviation, Einthoven used the letter R to designate the chief QRS deflection regardless of whether it was upward or downward. Lewis, on the other hand, called this deflection R when it was upward and S when it was downward and the vast majority of recent writers have done likewise. From time to time, however, attempts have been made to revive Einthoven's point of view.

In the last few years differences of opinion have arisen as to what constitutes a Q deflection and what an S deflection. When the QRS complex consists of

a single downward deflection, some writers call this deflection S on the ground that a downward deflection should not be labeled Q unless it is followed by an upward deflection. Others call it Q on the ground that this name should be given to every downward deflection not preceded by an upward deflection.

By far the greater part of the dissatisfaction with our electrocardiographic nomenclature has clearly been due to a lack of agreement as to what principles should govern the assignment of the letters Q, R and S to the components of the QRS complex. The symbols P, T_a, QRS, T and U have long been used in the same way by every one and present no difficulties. The electrocardiographic components which they represent may be regarded as at least approximately equal in rank. Each has a characteristic contour and a distinctive relation to other events of the cardiac cycle. According to our present conceptions each has a distinctive origin. The first (P) is held to represent all those electrical forces produced by depolarization (activation) of the auricular muscle, the second (T_a), all those electrical forces produced by repolarization of the auricular muscle. The third (QRS) and fourth (T) are held to represent all the electrical forces generated when these same physiochemical changes take place in the ventricular myocardium. The last (U) is less well understood, it apparently depends on some sort of readjustment of the polarization of the ventricular muscle. Since these physiochemical changes are closely related to the mechanical activities of the heart and necessarily occur whenever the heart beats, their electrical representatives can never be actually absent in any lead. Some may, however, be isoelectric or of such low voltage that they are imperceptible, and it often happens that a small deflection is difficult or impossible to detect because it is superimposed on a much larger one. Whatever the standpoint adopted, each of these components of the electrocardiogram is clearly entitled to a distinctive name. It is obvious that there is little danger of mistaking one of them for any of the others.

The individual components of the QRS complex are not entities of the same sort. They vary in number from subject to subject and from lead to lead. They have not been related to different events of the cardiac cycle, nor have they been shown to depend on the activities of distinct subdivisions of the ventricular muscle. No one of them has a distinctive contour. They differ one from another chiefly in direction and in sequential position and cannot be easily defined except in terms of these differences. All these deflections are alike in origin in the sense that all are produced by electrical forces generated by the spread of the excitatory process over the ventricular muscle. They can differ in origin only as regards the particular fraction of these forces which each represents. The individual fibers which contribute the elementary forces responsible for a given component in a given lead do not all lie in the same part of the ventricular myocardium. No one of the QRS components in any lead has a simple anatomic basis of this kind which would make its origin distinctive in the anatomic sense. The origin ascribed to any component is, mainly for this reason, dependent to a large extent on the point of view adopted, and no one particular point of view has gained such wide acceptance as to make it preeminent.

It has been suggested that the QRS interval should be subdivided in one way or another and that names should be assigned to parts of the QRS complex solely

on the basis of the particular subdivision of this interval within which they fall, rather than to the separate deflections of which it is composed. This suggestion is derived from the view that any part of the QRS complex written during a given interval of time in one lead is identical in origin with those parts of the QRS complex written during the same interval in other leads in the sense that it is produced by the same electrical forces. It is assumed that all the elementary electrical forces present at a given instant are equally effective, in proportion to their magnitude, in all the leads under consideration or that as far as these leads are concerned they are equivalent to a unique resultant electromotive force which may be substituted for them. Lintoven's equilateral triangle defines a resultant electromotive force the cardiac vector which may be substituted for the actual electromotive forces when dealing with limb leads, if the assumptions on which this triangle is based may be regarded as representing the true situation with sufficient accuracy for the purposes in mind. Now that it is customary to take precordial leads to which it is not applicable, as well as limb leads, it is not desirable to enthrone this point of view in our nomenclature and disregard others which are equally legitimate.

For this reason and because it greatly complicates the assignment of the letters Q, R and S to the initial group of ventricular deflections and the description of the form of the QRS complex, we believe that a downward deflection should never be labeled R on the ground that it occupies the same interval and represents the same resultant forces as an upward deflection in another lead to which this letter has been appropriately assigned. It is equally disadvantageous to label an upward deflection Q or S because it corresponds in time to a downward deflection in another lead to which the same letter has previously been allotted.

The considerations mentioned and the multiplicity of leads now in use fully justify the labeling of the QRS components of one lead without reference to the number or character of the QRS components in any other lead. The allocation of the symbols employed should be determined solely by the direction and sequence of these deflections in the lead under consideration.

RECOMMENDATIONS

1 The symbols P, T_a, QRS, T and U should be used to represent those deflections or groups of deflections to which they were originally assigned both when the electrocardiogram is normal and when it is abnormal.

2 In the majority of cases the QRS complex is superimposed on the T_a deflection. For this reason the level of reference from which the voltage of the QRS deflections is measured should be the level at which the first of these deflections begins. The voltage of an upward QRS deflection should be measured by estimating the vertical distance between the upper edge of the trace at the beginning of the QRS interval and the upper edge of the trace at the point where the deflection reaches its maximal elevation. The voltage of a downward deflection should be determined by estimating the vertical distance between the lower edge of the trace at the beginning of the QRS interval and the lower edge of the trace at that point of the deflection which is farthest from the reference level.

3 In order to indicate how the QRS complex should be subdivided for the purpose of assigning symbols to the deflections which it displays, we may describe a

QRS complex which has three components in the following terms. The first deflection begins at the onset of the QRS interval when the trace first leaves the reference level. From this point the trace rises or falls to a turning point where the direction of its motion is reversed. It may pass through a second or third turning point before crossing to the opposite side of the reference level.¹ At this crossing the first deflection ends and the second begins. The second deflection, necessarily opposite in direction to the first, must display one turning point and may display many; it does not end until the trace crosses the reference level for the second time. The third deflection begins at the second crossing and ends at the RS-T junction. No part of the QRS complex which does not display at least one turning point should be considered a separate deflection. If the RS-T junction is displaced and this junction and the last turning point lie on opposite sides of the reference level that portion of the trace which lies between the last crossing and the RS-T junction should be considered part of the deflection to which the last turning point belongs.

The earliest QRS deflection which lies above the reference level should be labeled R. Any downward deflection which precedes R so defined should be labeled Q. The first of any downward deflections which may follow R should be labeled S. The first of any upward deflections which may follow S should be labeled R', and the first of any downward deflections which may follow R' should be labeled S'. If it is necessary to label still later deflections of the QRS group, the symbols R'', S'' and so on should be used in accordance with the same principles. When R is absent, so that the QRS complex consists of a single downward deflection, this deflection should be labeled QS. In statistical studies QS, Q and S deflections should be considered separately.

A deflection is "notched" when it displays more than one turning point on the same side of the reference level. A deflection is "slurred" when it displays a distinct and local "thickening" on either limb or at its apex, owing to a sudden and pronounced change in the slope of the curve, or, in other words, in the rate at which the trace is rising or falling.

When the form of the QRS complex varies from moment to moment because of the effect of the respiratory movements on the position of the heart or for some similar reason, the classification of this complex should be determined by the variety of complex which is most abundant or, if no type is numerically predominant, by the outline of the complexes which are of intermediate form. Very small QRS complexes (largest deflection less than 5 mm) which display more than three components or multiple slurring and notching should be classed as "small and bizarre" or "vibratory."

4 The term RS-T junction should be used to indicate the point or shoulder which marks the end of the QRS complex, the point where the steep slopes of the QRS deflections are more or less abruptly replaced by the more gradual slopes which precede or comprise the first limb of the T wave. In many electrocardiograms the RS-T junction is followed by a nearly horizontal or gently sloping segment which lies on, above or below the reference level and ends with the onset of a much

steeper slope that rises or falls to the apex of T. It is agreed that the term RS-T segment is a useful name for this part of the ventricular complex when it exists, even though it is proper to regard it as the earliest part of the T deflection. When there is no point between the RS-T junction and the apex of T at which a sharp change in the slope of the trace occurs, this part of the ventricular complex should be called the first limb of the T wave. When the term RS-T segment is used without reference to some particular electrocardiogram or to some particular class of electrocardiograms, it should be understood to refer merely to that part of the ventricular complex which immediately follows the RS-T junction. The reference level for the measurement of the displacement of the RS-T junction should be the same as the level of reference for the measurement of the QRS deflections. The level of reference for the measurement of the RS-T segment, the T wave and the U wave should be the isoelectric level when this can be determined, otherwise it should be the level of the trace at the beginning of the QRS interval. The isoelectric level is the level of the trace at the beginning of the P wave when the P wave occurs in its normal relation to the QRS deflections and is not superimposed on T or U.

5 The term "diphasic T waves" should be applied to those final ventricular deflections which present two distinct turning points, one on each side of the level of reference. If the earlier turning point lies below this level and the latter above it, the diphasic T wave may be said to be of the minus-plus (\mp) type. If the reverse is the case it may be said to be of the plus-minus (\pm) type. When the term diphasic is used with reference to other deflections, to the QRS complex or to the ventricular complex as a whole, it should be used in the same sense.

6 When applied to the QRS complex to the T deflection, to any other electrocardiographic component or to RS-T displacement, the term "concordant" should signify that the largest deflection or displacement is in the same direction in lead 3 as in lead 1. Under the same circumstances the term "discordant" should signify that the largest deflection or displacement in lead 3 is opposite in direction to that in lead 1.

SECOND SUPPLEMENTARY REPORT BY THE COMMITTEE OF THE AMERICAN HEART ASSOCIATION FOR THE STANDARDI- ZATION OF PRECORDIAL LEADS²

ARLIE R. BARNES, MD, ROCHESTER, MINN., HAROLD E. B. PARDEE, MD, NEW YORK, PAUL D. WHITE, MD, BOSTON, FRANK N. WILSON, MD, ANN ARBOR, MICH., CHARLES C. WOLFERTH, MD, PHILADELPHIA

Early in 1938 the Committee of the American Heart Association for the Standardization of Precordial Leads and a similar committee representing the Cardiac Society of Great Britain and Ireland made joint recommendations with reference to a single precordial lead for

² It has been pointed out to us that the meaning of the last sentence of the third paragraph of our previous supplementary report is not clear. The correct interpretation of this sentence is as follows:

When the letters and subscripts specified are employed it shall be understood that in the case of the sternal leads the precordial electrode has been placed in the fourth intercostal space and that in the case of the other leads it has been placed on a line drawn from the left sternal margin in the fourth intercostal space to the outer border of the apex beat and continued around the left side of the chest at the level of the apex beat. When the apex beat cannot be satisfactorily located this line should be drawn from the left sternal margin in the fourth intercostal space to the point where the left midclavicular line crosses the center of the fifth intercostal space and should be continued around the left side of the chest at the level of this point.

¹ When the trace is descending it crosses the reference level at the instant when its lower margin reaches a position below that which it occupied at the beginning of the QRS interval. When the trace is ascending it crosses the reference level at the instant when its upper margin reaches a position above that which it occupied at the beginning of the QRS interval.

routine use. In a supplementary report published in the same year, the American committee recommended that when multiple precordial leads were taken the precordial electrode be paired either with an electrode on the left leg or with a central terminal connected through equal resistances of 5 000 or more ohms to three electrodes—one on the right arm, one on the left arm and one on the left leg. Six precordial points were recommended as suitable locations for the precordial electrodes, and these may be referred to as the C_1 , C_2 , C_3 , C_4 , C_5 , and C_6 positions. In the last few years the number of electrocardiographers who have abandoned single in favor of multiple precordial leads has rapidly increased, but there has been no uniformity as regards the number of leads taken, the location of the remote electrode paired with the precordial electrode or the locations of the precordial points regularly explored.

There has been a persistent demand that some further action be taken with reference to the standardization of precordial leads. We have therefore consulted and have attempted to reach an agreement with reference to the more important questions that have arisen in connection with this problem. It is agreed that many of these questions must be left unanswered until our knowledge of the precordial electrocardiogram is far more complete than at present. A great deal of methodical painstaking work is urgently needed with reference to the best location for the remote electrode, the desirability of taking precordial leads routinely and the best combination of locations for the precordial electrode. The present situation is not, however, due solely to inadequate information but also to a lack of complete agreement as to exactly what is meant by "best combination" and similar terms when used with reference to precordial leads, and as to whether the questions at issue are to be decided on empirical grounds alone or, if not, as to what basic principles should be given important consideration. The recommendations which follow must, for these reasons, be considered merely tentative.

The committee is agreed that a single precordial lead from the region of the cardiac apex, or from any other part of the precordium, is inadequate. When multiple precordial leads are taken, it is found that in the vast majority of cases the extreme right side of the precordium and the extreme left side of the precordium yield QRS complexes of more or less opposite form. Leads from a usually small region lying between those from which complexes of opposite types are obtained customarily yield complexes of intermediate or transitional form, which are often difficult to interpret when curves from points farther to the right and from points farther to the left are not available for comparison. The location and size of the region from which transitional complexes are obtained vary greatly from case to case and are not entirely constant in one and the same subject. When single precordial leads are taken from the outer border of the apex beat, the exploring electrode is, in actual practice, sometimes placed to the right of the region of transition mentioned and sometimes to the left of it, or within it. In serial observations on the same subject inaccuracy in placing this electrode or an alteration in the size or location of the region in question may be responsible for striking changes in the form of the curve obtained by what is technically the same lead.

This is only one of the causes for dissatisfaction with routine apical leads. When all cases are considered, regardless of whether the standard leads are normal or abnormal, it is perhaps true that a lead from the region

of the apex or from the left anterior axillary line at the level of the apex will display abnormalities of the ventricular complex more often than any other single precordial lead. When, however, only those cases in which the limb leads are normal are considered, this is certainly not the case. It is now clear that, when the standard limb leads are normal, the precordial leads most likely to yield significantly abnormal curves are those from points lying between the left sternal border and the midclavicular line. Consequently single apical leads most often fail completely in those cases in which multiple precordial leads have most to offer.

The committee believes that three is the least number of precordial leads that can be regarded as satisfactory for general purposes. It suggests that those who wish to reduce the number of such leads to a minimum take leads from the C_1 , C_4 , and C_6 positions. All are urged to take additional leads whenever possible. A lead from the C_2 or a lead from the C_4 position may show diagnostic abnormalities when equally significant changes fail to occur in other leads. Those who follow our recommendations must remember that inversion of the T deflections in leads from the C_4 position is frequently encountered in normal adult subjects. It is believed that those who have had little experience with multiple precordial leads would gain much worthwhile information by taking a full set of six precordial leads on a few normal subjects and on a series of patients with known cardiac abnormalities of the commoner types.

It is agreed that the information available does not permit a definite decision on empirical grounds as to the best location for the remote electrode with which the exploring or precordial electrode is paired. It is recommended that the precordial electrode be paired with an electrode on the right arm with an electrode on the left leg or with a central terminal connected through equal resistances of 5 000 or more ohms to three electrodes—one on the right arm, one on the left arm and one on the left leg. Some but not all members of the committee who formerly placed the remote electrode on the left leg now prefer to place it on the right arm. It has been observed that, when the precordial electrocardiogram is judged by the normal standards at present available, a lead from a given point on the precordium may yield an abnormal curve if the exploring electrode is paired with a left leg electrode (CF lead) even though the curve obtained from the same point by using the right arm electrode as the reference point (CR lead) is within normal limits. The opposite situation may also arise. It has also been observed that in certain cases of cardiac infarction in which diagnostic changes are present in the standard limb leads, CF leads display the most striking and CL leads (leads from the precordium to a left arm electrode) the least striking changes. These observations cannot, however, be interpreted as indicating that CF leads are always more reliable in the diagnosis of infarction than precordial leads of other kinds. There will be less confusion with reference to the effect of the remote electrode if it is clearly understood that each CR lead is equal to the corresponding CF lead plus standard lead 2, that each CL lead is equal to the corresponding CF lead plus lead 3 and that each central terminal lead is equal to the corresponding CF lead plus one-third the sum of

3. Recent observations indicate that in the vast majority of cases if not in all, the omission of these resistances has no appreciable effect on the form of the precordial curves obtained. Consequently it may be satisfactory to connect the central terminal directly to the three extremity electrodes without the use of intervening resistances of any kind. Further studies should be made before this method is generally adopted.

leads 2 and 3 and is the algebraic mean of the CR, CL and CI leads from the same precordial point

The committee does not desire at this time to make any recommendation bearing on the question as to whether precordial leads should be taken routinely or in selected cases only. It believes that precordial leads are most likely to yield information of diagnostic importance under the following circumstances: (1) whenever myocardial infarction is suspected or must be considered a possibility, (2) whenever myocardial disease is suspected or must be considered a possibility and other methods of examination yield no unequivocal evidence of cardiac disease, (3) whenever it is important to distinguish between right and left ventricular hypertrophy or between right and left bundle branch block and this cannot be satisfactorily done by other means, (4) whenever for any reason a complete cardiac study is indicated

Council on Pharmacy and Chemistry

REPORTS OF THE COUNCIL

THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING REPORT
AUSTIN I. SMITH, M.D., Secretary

ORGANOGRAPHY WITH DIODRAST CONCENTRATED SOLUTION 70 PER CENT

Winthrop Chemical Company, Inc. presented for Council consideration Diodrast Concentrated Solution 70 Per Cent. The preparation is proposed for use in a special diagnostic procedure for visualization of the heart, the ascending and descending aorta and branches, the superior vena cava, the pulmonary artery and branches, the coronary arteries and other structures of the heart and mediastinum. It has also been used for cholangiography by injection of the material into the common bile duct. For cholangiography the amount of Diodrast Concentrated Solution 70 Per Cent varies within wide limits, as little as 15 cc and as much as 100 cc has been required by direct injection into the common bile duct. For cardiopulmonary visualization 40 to 45 cc is injected in the average patient. The amount varies however according to the diameter of the chest, the size of the heart and certain pulmonary congestion. The manufacturer states that where visualization of the pulmonary circulation is desired 30 to 35 cc is sufficient.

The technic in using Diodrast Concentrated Solution 70 Per Cent for such a study is relatively complicated and requires accurate timing and teamwork between the physician, the patient and the roentgenologist. The method consists in injecting the substance into the blood and taking roentgenograms simultaneously with the concentration of the opaque material in the cardiopulmonary system. In addition a preliminary examination of the chest with the x-rays is necessary in order to obtain data for roentgenography. At times it is necessary to determine the circulation rate of the blood for accuracy. There has also been developed a multiple exposure method in which eight x-ray exposures are taken within ten seconds.

The contraindications include hepatic disease, nephritis and hyperthyroidism. Premedication with a barbiturate is advisable, epinephrine is administered when there is a possibility of an allergic reaction or low blood pressure. The results of this method have been reported chiefly by Robb, Steinberg and their associates.¹ They have reported no serious consequences following 238 injections in 127 patients of whom 42 were normal, 47 had pulmonary disease and the remainder heart disease.

¹ Steinberg, Israel and Robb, G. P. *Am Rev Tuberc* 38:557 (Nov.) 1938. Robb, G. P. and Steinberg, Israel. *J Clin Investigation* 17:July 1938. *Am J Roentgenol* 41:1 (Jan.) 1939. Robb, G. P. and Weiss, Soma. *Am Heart J* 8:650-670, 1933. Robb, G. P. and Steinberg, Israel. *Am J Roentgenol* 42:14 (July) 1939. Steinberg, Israel and Robb, G. P. *Radiology* 33:291 (Sept.) 1939. Steinberg, I. F., Grishman, A. and Sussman, M. L. *Angiocardiography in Congenital Heart Disease*. I. Dextrocardia to be published.

Results, according to this group of workers, have been of considerable aid in the detailed visualization of the cardiovascular system of the chest. They consider it safe, practical and of great value in the differential diagnoses of chest conditions. Von Baeyer and Liebow also consider the procedure an excellent one in the conditions mentioned. Stewart, Breimer and Maier² have reported in detail 4 cases in which cardiography was studied with Diodrast. A number of other investigators have also reported satisfactory results with the use of this substance with the conclusion that under the proper conditions there is a minimum of danger of harmful reactions with its use. In addition to the reports of these workers, the Council was referred to a number of reports submitted directly to the Winthrop Chemical Company totaling 849 cases in which 1399 injections were given. The manufacturer has also submitted photographs of x-ray plates showing typical findings from this technic.

The Winthrop Chemical Company has submitted laboratory data on the tolerance of Diodrast Concentrated Solution 35 Per Cent and of the Concentrated Solution 70 Per Cent. It is admitted that subcutaneous or intramuscular injections resulted in induration which subsides within seventy-two to one hundred and forty-four hours. After ten days no local effect can be demonstrated following subcutaneous injection and after six days following intramuscular injection. Microscopic examination shows that the inflammatory tissue response gradually diminishes after twenty-four hours. Following intravenous injection in rats there were no symptoms when 35 Gm per kilogram was administered. With administration of 40 Gm per kilogram slightly convulsive movements were observed, but the animals recovered within one-half to one hour, 45 to 50 Gm per kilogram was fatal. Intravenous injection of 25 Gm per kilogram resulted in mild hepatitis. Winthrop Chemical Company considers that in mice, dogs and man there was little tissue damage probably because the compound is excreted more rapidly than in the rat. Thus dogs injected with 40 Gm per kilogram over a period of three days showed no ill effects. There is a transient fall in blood pressure together with an acceleration of respiration following as little as 0.75 Gm per kilogram. Excretion of Diodrast is performed almost entirely by the kidneys; the substance is unchanged and there is little delay in excretion in dogs having kidney damage. With a dosage of 100 cc into a human being weighing 75 Kg the dose would approximate 1 Gm per kilogram, which is considerably below the toxic dosages for the dog, the rat and other animals.

While use of radiopaque substances in the visualization of cardiac and pulmonary blood vessels seems to be highly promising, the technic of using a substance such as Diodrast Concentrated Solution for this purpose is relatively complicated when compared with the use of Diodrast 35 Per Cent of similar substances for visualization of other organs. It is entirely possible that the inherent nature of cardioangiography requires a skilled and meticulous technic. Most of the experimental work on the use of Diodrast 70 Per Cent for cholangiography was performed by Robb, Steinberg and their associates. Several other groups of workers, however, have obtained satisfactory results using the technic described by these investigators. It appears that this technic can be mastered by experienced workers who have the proper facilities although it would be dangerous in the hands of persons who are inexperienced or who use the technic in a casual manner. Under the proper conditions the use of Diodrast 70 Per Cent for cholangiography appears to be a relatively safe procedure, since few untoward results have been encountered. This is, perhaps, because of the precautions taken by skilled workers.

As this diagnostic procedure appears to be of some value for the visualization of thoracic organs as well as the biliary tract and possibly other organs, the Council voted to accept Diodrast Concentrated Solution 70 Per Cent (Winthrop Chemical Company, Inc.) for inclusion in New and Nonofficial Remedies, to be used however, only by specialists or others who have the proper facilities and experience necessary for the relatively complicated technic.

ENVIRONMENTAL TEMPERATURE AND MORTALITY IN BURNS

The use of heat versus cold as local therapy for injured or infected tissue continues to arouse debate. Enthusiasms for and diatribes against hot or cold applications date back to the time of Hippocrates. Although exact physiologic studies have shown the relative reactions which follow the heating or chilling of tissue, most physicians are still undecided when confronted with the necessity of making a decision as to whether to advise a hot water bottle or an ice cap.

The problem of heat versus cold reaches a higher plane of clinical importance in the treatment of surgical shock. For decades the shocked patient was surrounded with hot water bottles or even actually heated with various appliances. In a recent editorial¹ in *THE JOURNAL* the subject of cooling in shock was discussed at some length and the deleterious effects of warming the shocked patient were evaluated. The discussion was based not only on well established physiologic considerations but also on the recent important experimental studies of Blalock.

The influence of cold and heat on the human being's environmental temperatures has received but scant attention by investigators. Undoubtedly the availability of air conditioning equipment in recent years will stimulate such studies. Right now, during the present global war, the fact that our soldiers, sailors and marines must fight in such wide extremes of temperature emphasizes urgently the importance of knowledge concerning the influence of environmental temperature on various injuries sustained by our fighting men. A provocative experimental study on the influence of environmental temperatures on the mortality in extensive burns has

just been published by Elman, Cox, Lischer and Mueller.² This study suggests that these considerations are really of paramount importance. These workers, combining the research facilities of a university and a commercial institution, have observed striking effects at environmental temperatures of 32, 55, 75 and 99 F. Rats under deep anesthesia were subjected to uniform severe thermal injuries involving 75 per cent of the skin surface. When they were stored at a temperature of 75 F, mortality was 25 to 32 per cent. However, when the animals were placed in colder rooms set at 32 or at 55 F the mortality rose to 100 per cent. When placed in a heated environment of 99 F the mortality also increased to 100 per cent. These differences are so pronounced as to suggest a profound influence of environmental temperature on the vital reparative processes which tend to compensate for the deleterious effects of severe burns. Indeed, they tend to show that 75 F is somewhere near the optimal environmental temperature, a fact which is not surprising as this is usually considered the most comfortable level. Quite similar findings were reported by Sanford Rosenthal³ in a paper appearing at about the same time. The observations were made on mice during the course of experiments on the chemotherapy of burns in the laboratories of the U. S. Public Health Service.

The practical inferences which flow from these simple but clearcut observations are significant. First they add evidence to that already mentioned in surgical shock¹ that the common practice of covering the burned patient with a heated cradle may be definitely deleterious. Such a view has found expression during the past decade in several clinical reports on the treatment of burns. These bedside objections to the use of heat in burns find ample justification in the experiments just cited. These studies, however, also suggest that even in temperate climates when the summer temperature rises to 100 F or in tropical climates where this level may even be exceeded, air conditioned rooms may well prove an important method of reducing the hazard of a fatal outcome due to severe burns. It also suggests that further investigations as to the influence of environmental temperature in other conditions will probably also reveal important influences from which therapeutic inferences may be drawn.

EXAMPLES OF RECENT PROGRESS
IN VIRUS RESEARCH

A new virus papilloma is described by Parsons and Kidd,¹ a noncancerous papillomatosis of the oral lining of domestic rabbits. The growths are situated mainly on the under side of the tongue. Parsons and Kidd have extracted a filtrable virus from these growths which reproduces the disease in the oral mucosa of rabbits. As yet there has been no effect in other rabbit tissues or in the oral mucosa of other animals. This form of virus papilloma, of which there now is a considerable number, does not show any tendency to become cancerous. Its natural transmission appears to be "by a direct landing along in the family."

Further studies of feline agranulocytosis by Syvertson and Lawrence and their associates² show that the specific virus of this disease is not related to various other pathogenic viruses, human and animal, and that it produces a specific immunity. The disease is characterized by profound leukopenia, proliferation of reticuloendothelial cells and intranuclear inclusion bodies.

Chambers and his associates³ report that studies by ultracentrifugation indicate that influenza A virus is one of the smallest specific agents so far isolated, also that this virus is one of the least complex, as it appears to be composed principally of nucleoprotein.

By means of differential ultracentrifugation of infected human, monkey and chimpanzee stools, Melnick⁴ obtained the virus of epidemic poliomyelitis in purified and concentrated form. The virus so isolated caused poliomyelitis in monkeys, hence it appears that a sensitive method for detecting the virus has been found.

Sanders and Alexander⁵ report the isolation and identification of a filtrable virus from conjunctival scrapings from 2 patients suffering with epidemic keratoconjunctivitis. This virus proved to be pathogenic for mice and it produced a mild but characteristic keratoconjunctivitis in a human volunteer, whose serum contained specific antibodies for the virus one month after the infection. Antibodies were also demonstrated in the serum of patients who had passed through attacks of the disease.

These examples of recent research on viruses are not intended as an exhaustive review, they are more or less random selections which show that the study

of pathogenic filtrable viruses continues to give results of scientific and practical value. The opportunities for research in the field of the viruses grow daily more numerous, the results promise vast benefit to mankind.

Current Comment

SULFAGUANIDINE AND SUCCINYLSULFATHIAZOLE FOR BACILLARY DYSENTERY

During the past year there have been numerous reports on sulfaguanidine and a smaller number on succinylsulfathiazole in the treatment of bacillary dysentery, both in the active state and in carriers. Lyon,¹ who reported more than 300 cases, found sulfaguanidine effective in acute bacillary dysentery but less potent after the first five to ten days, in recurrent attacks and in the chronic forms. It was effective in acute bacillary dysentery in adults and also in infants and children. He discussed the results with succinylsulfathiazole in 14 cases of severe or moderately severe bacillary dysentery. This agent appeared to have all the virtues of sulfaguanidine as to therapeutic efficacy and freedom from untoward effects. Among the most recent reports on this subject is that of Bulmer and Priest,² who during 1941 treated 554 soldiers in a military hospital in the Middle East for bacillary dysentery. Seventy-six of these were given sulfaguanidine. These cases were not consecutive but were selected because of (1) the acuteness of the diarrhea, (2) the severity of the toxemia, (3) the persistence of the diarrhea or (4) the military importance of an early recovery among a few "key" persons. In this small series the drug failed to have any effect on 3 persons, although all eventually recovered. There were only two deaths. In the remaining cases the response to the drug was prompt and often dramatic. The drug was lacking in toxic effects. They believe, as do several of the others³ who have reported on the subject, that sulfaguanidine is a specific drug for bacillary dysentery. From the evidence, so far as it is as yet available, succinylsulfathiazole⁴ appears to be practically as effective and nontoxic as sulfaguanidine and, if further investigation bears out preliminary observations, may be proved somewhat superior.

"LOST PLASMA" IN HEMORRHAGIC SHOCK

There is a theory known as the "lost plasma" theory, that death results in hemorrhagic shock from reduction in the blood volume by passage of plasma through the capillaries into the tissues. The evidence cannot be said to be absolutely conclusive. An experimental study of the problem has been made on dogs by Fine and Seligman,¹ using a radiobromoprotein the preparation of which they describe in detail, for the identification of plasma proteins. By injecting this radioprotein into the circulation and tracing its subsequent course, they could follow the movement of plasma proteins from the blood into the tissues in the normal dog as well as in dogs in hemorrhagic shock. The radioactivity of the circulating plasma and of the tissues was the same in the shock dogs as in normal controls. The evidence does not indicate that death from hemorrhagic shock in dogs is caused by a progressive decline in the blood volume due to the passage of plasma into the tissues. The conclusion drawn by Fine and Seligman from their experiments that in hemorrhagic shock of dogs plasma loss by passage into the tissues is not a crucial factor seems warranted.

CHARACTERISTICS OF INSTITUTIONAL INMATES IN 1940

On April 1, 1940 according to an analysis of statistics recently issued by Capt. of the Bureau of the Census, there were 591,365 persons 14 years old and over in mental institutions.¹ In addition, persons in homes for the aged, infirm or needy numbered 245,026. Inmates of prisons and reformatories totaled 217,919 and inmates of local jails and workhouses 99,249. Officers and attendants in institutions were excluded from the statistics of the institutional population, as were all persons in tuberculosis sanatoriums. Of all inmates 70 per cent were native whites, 16 per cent were foreign born whites and 14 per cent were nonwhites. Males constituted 93 per cent for prisons and reformatories, 91 per cent for local jails and workhouses, 59 per cent for homes for the aged, infirm or needy and 54 per cent for mental institutions. The percentage of all persons 14 and over inhabiting institutions was 1.16 for the United States as a whole, the District of Columbia had the highest percentage with 1.72, followed by Delaware, Virginia, Maryland and New York. Strangely Columbus, Ohio, led all other large cities with 3.59 per cent of all persons 14 and over in an institution, Memphis, with a corresponding figure of 0.28 per cent, seems to belie its reputation for criminality. The figure of 0.56 per cent for New York City contrasts with 1.78 per cent for one of its constituent boroughs—Richmond.¹ The sometimes curious sidelight effects of these figures remains largely unexplained. However, the over-all picture is clear: one out of every hundred persons 14 years and over in the United States is an inmate of an institution.

**A COUNTY PROGRAM FOR THE
PREVENTION OF DEAFNESS**

Washington County, Md., is inaugurating a program for the prevention of deafness to be conducted as a function of Services for Crippled Children. The need of such a program may be gleaned from a previous survey which has shown that some 25 per cent of school children in the county have impaired hearing. The program will augment the limited facilities for otolaryngology in the community and will provide for radon therapy for adenoid tissue. The following immediate steps are projected: 1. Education of parents in the necessity for proper medical care for children with acute otitis media. This is to be accomplished through Parent-Teacher Association meetings, distribution of pamphlets, newspapers, preschool and school medical conferences and home nursing visits, especially for school children with earaches. 2. Testing of hearing in public and parochial schools. Each child will be tested approximately three times during his school life. The screening test will be performed by a trained technician from the Frederick School for the Deaf. 3. Establishment of an ear, nose and throat clinic to be conducted by a trained specialist. Provisions will be made by arrangement with the local hospital and the local ear, nose and throat profession for special treatment such as tonsil and adenoid operations and mastoid operations. Dr. C. H. Halliday, director of Services for Crippled Children of the State of Maryland Department of Health, emphasizes that the program is to be carried out under the supervision of the county health officer with the approval of the county medical society. It is to be a cooperative study by the health agencies, medical societies and state board of education. The private physician is to be brought into active participation.

THE RESPIRATORY PATTERNS AT BIRTH

The physiologist Sir Joseph Barcroft could not find any detailed description of the exact ways in which children born normally begin to breathe. In a small series of observations of normal births by mothers "to whom not more than an occasional whiff of general anesthetic was given" he recognized three obvious patterns of initial breathing: the rhythmic, the single prolonged inspiration and the gasp. The rhythmic type begins on emergence of the emerging head and is associated with only slight cyanosis. In the other two types there is considerable to even deep cyanosis. The gasp is dependent on the lower part of the medulla, the higher parts of the brain being functionless on account of asphyxia, of which cyanosis is the external sign. In rhythmic respiration, parts higher in the brain are functioning. In the initially protracted inspiration the respiratory effort seems to consist of a number of single inspirations without corresponding expiration. Owing Barcroft¹ suggests, to failure of the inhibitory stimuli associated with normal respiration. In all probability the study of a larger number of cases than Barcroft's may furnish more data on the initial respiratory pattern and its relation to sensitivity to asphyxia and other influences of the brain at birth.

¹ Barcroft Joseph. Respiratory Patterns at Birth. *Cambridge University Medical Society Magazine* 20: 6 (Michaelmas Term) 1942.

MEDICINE AND THE WAR

In this section of The Journal each week will appear official notices by the Committee on War Participation of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war and such other information and announcements as will be useful to the medical profession

ARMY

AUSTRALIA PROVIDES YANKS WITH HOSPITAL

The government of Australia, under its program of reciprocal lend lease has provided the United States with a new ten story hospital "somewhere in Australia" to be used by American soldiers, sailors and marines recuperating from illness and wounds suffered in the Pacific. The transfer does not involve payment of any sort. The building, construction of which was undertaken as a civic enterprise at a cost of \$3,000,000 was taken over and adapted for the American forces to accommodate several times its original capacity. It is complete with laboratories, operating rooms, nurses quarters and administrative offices. All ten stories are now being used. The main buildings are well arranged. Verandas for convalescents are supplemented by broad spaces on the roof, where servicemen gather to rest in glass enclosed rooms or in the open air. Recreational equipment is available. The new hospital is one of many Australian contributions to the United States forces in the Pacific as reciprocal lend lease. Australia provides most of the food for our troops on the mainland and has recently undertaken to supply food as well to American troops in New Guinea, the Solomons and other islands in the South and Southwest Pacific theaters.

stood were Brigadier General Remartz, Commandant, Brig Gen W E Carter G S C, Chief of Staff, Army Air Forces, Gulf Coast Training Center, Col W C White, A C, Commanding General Instructors School, Col Walter C Jensen, M C Acting the Air Surgeon, Col Fabian Pratt, M C, Surgeon Fourth Air Force, Drs Eugene R Lewis and Isaac H Jones of Los Angeles, members of the original Medical Research Board, Lieut Comdr Robert J Hunter (MC), USNR, the first flight surgeon to report for duty as such, and Dr A C Bachmeyer, Associate Dean, Department of Biological Science University of Chicago, a pioneer in Aviation Medicine. Lieut Col W Harvey Kernan, M A C, executive officer of the school, and Major Harold F Pierce, M C Randolph Field, members of the first group reporting to Hazelhurst field for duty at the original Medical Research Laboratory were also present. The anniversary dinner was attended by members of the staff of the school and their wives, officers of the Air Force past commandants of the school and out of town guests. Saturday was devoted to scientific meetings.

MOBILE X-RAY UNITS FOR RUSSIA

Thirteen mobile trailer units, each fitted with portable x-ray equipment that can be set up during battle or air raids in twenty minutes, have been purchased in this country by English donors for the Russian army. Spanish refugees in England donated two of the units and various English organizations the others. Two units will be shipped first to England for acceptance ceremonies featuring Mrs Ivan Maisky, wife of the Russian ambassador to England. The trailers are equipped with x-ray units manufactured by the Westinghouse X-Ray Division, Baltimore. Each trailer carries complete facilities also for fluoroscopy. The x-ray equipment can be quickly removed from the trailer and set up in a shack or tent by two members of the medical crews assigned to each unit. Complete darkroom equipment is provided for making permanent records of injuries on regular size x-ray films. The trailers are constructed of sheet metal with hinged sides and ends to permit speedy loading. To prevent damage the x-ray apparatus is packed in padded boxes, which are arranged to receive each component part of the equipment in its proper order. Power to operate the equipment is supplied by a generator mounted in the trailer and driven by a gasoline engine. An ample length of supply cord enables the generator to be stationed up to 150 feet from the x-ray unit if necessary.

COLONEL DIBBLE AND MAJOR GLEASON REPORTED MISSING

An airplane accident which occurred in the Southern Pacific area was recently reported in the newspapers and among those missing were Col John Dibble and Major James J Gleason, both of the Medical Corps. Colonel Dibble was commissioned a first lieutenant in the medical corps in January 1917, in which year he graduated from the Army Medical School following his graduation in medicine at the University of Pennsylvania in 1915. He was an honor graduate of the School for Flight Surgeons in 1919 and graduated from the Medical Field Service School advanced course in 1934. He was appointed from New Jersey. Major Gleason, whose home address was Long Island City, N Y, was born in 1897 and graduated from Loyola University School of Medicine, Chicago, in 1928. Major Gleason entered the military service about Aug 1, 1942.

SIXTEEN NURSES MADE LIEUTENANT COLONELS

The War Department, acting under the authority of the nurse promotion act of Dec 22, 1942, has advanced sixteen captains of the Army Nurse Corps to the grade of lieutenant colonel and has promoted an additional fifteen captains to the grade of major. The promotions involve no transfers, although a few occurred recently incident to the changes in the nursing division of the Office of the Surgeon General, which changes the *Army and Navy Journal* says, were the natural accompaniment of a change in the superintendent of nurses. The fifteen majors are eventually to be increased to a total of thirty-nine by subsequent promotions. A number of additional promotions to the grade of captain will be made soon, not only to fill the vacancies created by these promotions, but also to increase the number of captains in the Army Nurse Corps to one hundred and eighty-one.

TWENTY-FIFTH ANNIVERSARY OF SCHOOL OF AVIATION MEDICINE

The twenty-fifth anniversary of the School of Aviation Medicine was celebrated, April 1-3, at Randolph Field, Texas. Several of the original group who assembled at Hazelhurst Field, Mineola, Long Island, N Y, on Jan 19 1918 to establish formally research and training in aviation medicine were present for the exercises. The program consisted in the dedication of a memorial window in the Post Chapel (THE JOURNAL, March 13, p 846). This window, bearing the wings of the flight surgeon, the seal of the school and depicting St Christopher, the patron saint of aviators and all travelers, was presented to the chapel by Class 42-F Aviation Medical Examiners, which was under instruction at this station from Sept 21 to Dec 17, 1942. Following the dedication of the window the new research laboratory building was dedicated by Brig Gen Eugen G Remartz, commandant of the school.

A review of the classes in aviation medicine, aviation physiology, enlisted flight surgeons' assistants and the Detachment Medical Department was held on April 2. In the reviewing

PRESBYTERIAN HOSPITAL (CHICAGO) UNIT ACTIVATED

On March 19, twenty-four doctors and thirty-two nurses of the Thirteenth U S Army General Hospital (sponsored by the Presbyterian Hospital, Chicago) left for Camp Robinson, Arkansas, to joint seven other medical officers and some three hundred and sixty-five enlisted men who had reported at Camp Robinson at an earlier date (THE JOURNAL, March 13, p 846), thus reactivating Base Hospital No 13, which was sponsored by the Presbyterian Hospital in service in the first world war. The commanding officer of the Thirteenth General Hospital will be Col Lyle S Powell, who served in the first world war in France and recently was a member of the staff of the Army Field Service School, Carlisle Barracks, Pennsylvania. Colonel Powell formerly was a member of the faculty of the University of Kansas. The other medical and dental officers on duty with the unit are as follows:

MEDICAL SERVICE

Lieut Col Homer K Nicoll	Capt John Tysell
Major O Earle Gray	Capt Bertram O Nelson
Major George W Stupp	Capt Donald A Morrison
Major George C Turner	Capt Herbert C Breuhans
Major C Jack Harrison	Capt Ralph E Talbott
Capt Joseph Bennett	Lieut Richard P Morris
Capt James Webster	Lieut W L Riker

SURGICAL SERVICE

Lieut Col Edwin M Miller	Capt Clayton E Brock
Major Linden J Wallner	Capt Charles S Textor
Major Cyril V Crane	Capt Cecil Draa
Major Francis H Straus	Capt Frank B Papiernik
Major Richard A Gilehrst	Capt Hugo C Brum
Major Stanley Lawton	Lieut Fred Max Marquis
Major Egbert H Fell	Lieut William C Cameron
Major Arthur Diggs	Lieut Isaac Michael
Major John Olwin	Lieut Frederic A DePeyster
Capt Stanton A Friedberg	

LABORATORY SERVICE

Major Evan Barton	Lieut Ralph L High
Capt Franklin Moore	

X-RAY SERVICE

Capt George L Pelkey	Lieut Edward S Murphy
----------------------	-----------------------

DENTAL SERVICE

Capt Arthur R Hanson	Lieut A Leo Klein
Capt John M Spence	Lieut Roger K Stockton
Lieut Richard Holie	

The chief nurse will be 1st Lieut Nelle Crout and the other nurses, when recalled to the unit, will bring the number of nurses to about a hundred. Among the enlisted men in the present unit are several whose fathers served with the original Base Hospital No 13 at Limoges, France, from May 1918 until after the armistice was signed.

CAPTAIN WOLFE AWARDED SOLDIER'S MEDAL

The War Department announced on March 1 the award of the Soldier's Medal to Capt Russell S Wolfe of the Medical Corps for heroism on Aug 8 1942 in the vicinity of Requim Bay in the Solomon Islands. Captain Wolfe and two infantry soldiers manned a small skiff and in a heavy and dangerous surf rescued the survivors after an army plane had been forced to land at sea. Captain Wolfe's home address is Houston, Texas.

NEW SUPERINTENDENT OF ARMY NURSE CORPS

Miss Florence A Blanchfield, Lieutenant Colonel, Army Nurse Corps, has been appointed superintendent of that corps, effective June 1, to succeed Mrs Julia O Flikke, who will retire on May 31. Miss Blanchfield was assigned to the Surgeon General's Office in 1935 and was appointed assistant superintendent of the Army Nurse Corps in 1939.

AVIATION MEDICAL EXAMINERS

Another class in aviation medicine for aviation medical examiners graduated recently. The didactic portion of the course was conducted at the School of Aviation Medicine in Texas and the practical portion at three army air forces classification centers. Graduation exercises were held at each of the three centers. The list of graduates follows:

ALABAMA	GEORGIA
William Thomas Daniel 1st Lieut Birmingham	Bertram Price Aver Jr, 1st Lieut, Augusta
George E Johnson Captain Urrah Madison Reeves Popl Captain Palladega	Samuel Young Brown 1st Lieut, Atlanta
ARIZONA	Fred Jessup Coleman 1st Lieut, Augusta
Erroll Payne Palmer Jr 1st Lieut Phoenix	Hynden Harkney Donahue, 1st Lieut, Augusta
Russell O Raymond 1st Lieut, Flagstaff	John P Jones 1st Lieut, Macon
ARIZONA	Maurice Rich, 1st Lieut, Atlanta
Orville B McCoy 1st Lieut Har rison	IDAHO
John W Smith 1st Lieut Little Rock	Lewis Baty Hunter, 1st Lieut, Wallace
CALIFORNIA	Albert Milton Peterson 1st Lieut, Wallace
Deane Taylor Adams 1st Lieut, San Jose	David Warren Springer 1st Lieut, Boise
August Alexander Antipa 1st Lieut San Francisco	ILLINOIS
Robert Lynwood Blackmun 1st Lieut Los Angeles	George Jaeger Best, 1st Lieut, Teoria
Frank Herbert Bowles Jr, 1st Lieut San Francisco	Walter August Dock 1st Lieut, Chicago
Burton Kent Brock 1st Lieut Bakersfield	Edward F Cannon 1st Lieut, Chicago
Herschel S Burns Captain Ar cadia	John Sheldon Clark Jr, 1st Lieut, Chicago
Harold Galeener Carter 1st Lieut San Diego	Wendel Ravburn Freeman 1st Lieut, Champaign
Maxwell Peterson Fonda 1st Lieut Los Angeles	Robert Heimer Captain Chicago
Hark Durand Carrington 1st Lieut San Francisco	Cletus Timothy Kearney 1st Lieut, Griley
Heinrich Sofas Crueser Major Woodland	Milton Harold Partridge 1st Lieut, Irian
Alfred John Heldfond 1st Lieut Los Angeles	Voris Ralph Payne 1st Lieut, Wayne City
William Cloyce Huff 1st Lieut Ventura	William P Phillips 1st Lieut, Chicago
William Travis Kelley 1st Lieut Oxnard	Robert Bruce Rutherford Captain Leoria
Jack Albert Lighthill 1st Lieut Santa Monica	William Bernard Sermon 1st Lieut, Chicago
Edward Gerald Noel 1st Lieut, Beverly Hills (Los Angeles)	Henry Fred Otto Stenbock 1st Lieut, Villa Park
Clement Joseph Molony Captain, Los Angeles	Kent Lincoln Wattleworth 1st Lieut, Newton
Irving George Newman 1st Lieut Beverly Hills	INDIANA
Frederick Powers Herald 1st Lieut Ft Centro	Harold C Adams Captain Indiana

NAVY

VENEREAL DISEASE DROPS TO
NEW LOW

Venereal disease rates in the Navy have dropped to new all time lows a special subcommittee of the National Advisory Police Committee on Social Protection was told on April 2 by Comdr T J Carter, who is in charge of preventive medicine in the Bureau of Medicine and Surgery. Sick list admissions last year in the entire Navy, ashore and afloat due to syphilis, gonorrhea and the lesser venereal infections totaled 36 per thousand men, a decrease of 29 per cent from 1941 and of 55 per cent since 1940. "During 1942, only 28 per cent of the Navy's venereal disease problem came from foreign ports," Commander Carter revealed. While this proportion and the total number of cases, may increase in the near future, the fact remains that the bulk of the problem will remain in the United States for some time. It is particularly important he said from the point of view of civilian control that communities in or around which there are naval activities appreciate the degree to which they are involved in the total Navy problem.

AWARDS TO NAVAL MEDICAL OFFICERS

The Bureau of Medicine and Surgery U S Navy, Washington, D C, announced in its March 1 weekly news the award on February 22 of the Purple Heart to Comdr B W Hogan (M C) of the aircraft carrier *Hasp* and to Lieut G H McAteer (M C) of the aircraft carrier *Hornet*. The bureau announced also in its February 15 issue of the weekly news the award of the Navy Cross on February 11 to Lieut Edward P McLarney of the Medical Corps for bravery in action in the Solomon Islands. Lieutenant McLarney is a native of Washington, D C, where he practiced medicine after graduating from Georgetown University until he entered the Navy in 1937. The citation was as follows: "During the night action of December 13-14, when prepared to move his first aid station after the enemy advance made it unsafe, many wounded arrived for treatment. He coolly disregarded hostile fire from front and flank and, assisted by a greatly reduced number of hospital corpsmen, rendered aid to approximately 200 casualties during the engagement."

DENTAL OFFICERS PROMOTED TO
NAVY CAPTAINS

Comdr C Raymond Wells, chief dental officer of the Selective Service System, Washington, D C, and president elect of the American Dental Association and Comdr Frederick F Molt of the Great Lakes Naval Training Station in Illinois have been promoted to the rank of captain in the Navy. According to the *Naval Surgeon*, both officers have served with distinction in many positions in military and in professional life. This is the first time, it is said, that two members of the dental corps reserve have been promoted to the rank of captain in the U S Navy.

REST HOME FOR TORPEDOED SEAMEN

A rest home for torpedoed seamen was opened on a beautiful site at Camp Kittiwake, Pass Christian, Miss., January 11. Participating in the ceremony were George H Terriberry, chairman of the New Orleans Port Area Committee, United Seamen's Service and Capt Roger J O'Sullivan, regional representative Recruitment and Manning Organization War Shipping Administration. The speaker was Mr Marshall E Dimock, director of Recruitment and Manning Organization. The home is for the purpose of giving torpedoed seamen an opportunity of recovering from the psychic trauma resulting from experiences following the torpedoing of their ship at sea and is intended to provide them with a period of complete rest and relaxation.

SHIPS NAMED AFTER FAMOUS
MEDICAL MEN

In recent months the merchant marine has honored the small group of medical men who in its earlier years made Johns Hopkins University famous throughout the world by naming new Liberty ships the *William Osler*, the *William Welch*, the *William S Halsted*, the *Howard A Kelly*, the *John J Abel* and the *Franklin P Mall*. The Maritime Commission has a committee whose duty it is to name the new ships and that committee is free to honor thus any Americans it deems worthy of recognition for services to their country and to humanity.

FOOD RESEARCH SECTION

The Bureau of Supplies and Accounts of the Navy has established a Food Research Section in its Subsistence Division in order to accentuate the efforts of the Navy to improve the nutritional value and quality of the navy ration. Food chemists and technologists both commissioned and civilian, who are experts in food research, will comprise the staff of the new section. The officer in charge will be Lieut Comdr Arthur J Harrington, SC USNR, formerly chief of the Import Section Office of Civilian Supply War Production Board.

INSTRUCTION IN THE SPECIALTIES

Fifteen regular and reserve naval medical officers were assigned recently to duty under instruction in roentgenology and radiology at major naval hospitals. Ten medical officers are under instruction in anesthesia at the Mayo Clinic Rochester, Minn. and six officers at the Lakes Clinic, Boston. On completion of these courses these officers will be assigned to continental and mobile hospitals.

NAVY PERSONALS

Several West Virginia physicians now in the Navy are members of the staff of the U S Naval Hospital at Quantico, Va. Comdr W M Sheppe, formerly of Wheeling, who has been serving as chief of medicine at the Naval Medical Specialist Unit No 40, has been promoted to the rank of captain U S NR. Captain Sheppe is an associate editor of the *West Virginia Medical Journal*. Lieut Comdr H G Little of Wheeling, who is in charge of the laboratory, has been promoted to the rank of commander. Lieut Comdr Russell Kevel of Charleston is chief of surgery. Lieut Comdr James K Stewart of Wheeling is director of the eye, ear, nose and throat department and Lieut A L Osterman of Wheeling is neuropsychiatrist. Capt John Brewster of Weston, who has been in the naval medical corps for some years, is executive officer.

LIEUTENANT BATES MISSING

Lieut John H Bates, M C, U S Naval Reserve, formerly of New Preston, Conn., has been reported missing in action since a destroyer on which he was serving was lost February 1. Dr Bates graduated at Yale University School of Medicine, New Haven, in 1941 and was commissioned lieutenant in the U S Naval Reserve. He reported for active duty about July 15, 1942.

WOMEN PHYSICIANS

Six lieutenants (jg) W-V(S), USNR, who are physicians will graduate from the basic course of instruction at the Naval Medical Center, Bethesda, Md., on April 27 and will be assigned to duty at the Naval Training School, Women's Reserve, the Bronx, New York.

CIVILIAN DEFENSE

GUARDING MILITARY INFORMATION

The United States government is engaged in an intensive campaign to impress on the public the importance of guarding information of a military nature. Beginning in April booklets containing personal messages from Admiral King, General Marshall and J. Edgar Hoover on this subject will be distributed through the facilities of the Office of Civilian Defense to the immediate families of men in the armed services. It is vital that every one observe the rule of not talking about any information of a confidential nature which one may possess.

EMERGENCY MOBILIZATION OF MOTOR VEHICLES

The Office of Civilian Defense, Washington, D. C. issued on March 3 Operations Letter No. 114, defining the functions of regional, state and local transport officers and clarifying the relations of transport officers recommended in Operations Letter No. 86 with the Office of Defense Transportation and the American Red Cross under plans made for the mobilization of commercial motor vehicles to serve local citizens' defense corps. This letter states that the Office of Defense Transportation has the right of jurisdiction over all domestic transportation including commercial motor vehicle equipment and in the war effort may allocate its use in the most effectual manner.

By joint action of the Office of Defense Transportation and the Office of Civilian Defense, concurred in by the War and Navy departments, a plan for the mobilization of commercial vehicles to serve the War and Navy departments and local citizens' defense corps has been consummated, under which all local commercial motor vehicles except organized motor transport companies, are now available immediately to the transport officer of each citizens' defense corps for local service in case of war emergency without application to the Office of Defense Transportation. Also, under this plan, all transport facilities required for civilian service outside the local area will be pro-

vided by the Office of Defense Transportation on request of the commander of the local citizens' defense corps. Among such outside transport service is that for evacuation of civilians, for reinforcement of distant communities, for transfer of injured persons to emergency base hospitals in other cities or areas and for transportation of emergency civilian supplies between communities.

PASADENA REORGANIZES EMERGENCY MEDICAL SERVICE

The civilian defense councils cooperating with the Red Cross have reorganized the emergency medical services in Pasadena and Altadena, Calif. The revised plan fits into the county setup. Instead of having seventeen casualty stations as dispatching centers for medical teams, now there are only six in the combined area. These teams comprise a physician, a nurse, several corps men, an ambulance and a squad car, to be dispatched from six base hospitals in Pasadena and one in Altadena. Dr. Leroy B. Sherry, chief medical officer of Pasadena, Dr. Paul Kinney, chief physician inspector of the Pasadena schools, Dr. H. W. Benjamin of the Altadena Defense Council and others cooperated in the revision of the emergency medical service plans.

LIST OF PUBLICATIONS

The Office of Civilian Defense, Washington, D. C., announced on March 17 the first revision of its official list of Office of Civilian Defense publications and posters for the use of leaders in local defense councils. There is no charge for this list when it is used for this purpose; however, individuals not engaged in civilian defense who wish to secure these publications may purchase them from the Superintendent of Documents, Washington, D. C., which is the only agency authorized to sell federal publications.

MISCELLANEOUS

RUSSIAN WAR RELIEF, INC.

This relief agency, with headquarters at 11 East 35th Street, New York City, telephone Murray Hill 6-3203, has issued an appeal pointing out that the Russian medical profession is in dire need of medical supplies and surgical instruments to care for the wounded and the refugees. The appeal is made to the American people for contributions in kind rather than primarily in cash. Russian War Relief, Inc., has issued a lengthy official Russian list of medicines, laboratory and hospital supplies, drugs and surgical instruments which are particularly needed. Among the items are various kinds of surgical forceps, needle holders, scissors, knives, retractors, saws, elevators, autoclaves, trial lens sets, transfusion needles, spinal needles, rubber sheeting, surgeon's gloves, tourniquets, ice bags, sulfanilamide, caffeine, procaine and digitals.

PREFERENCE RATINGS TO REPAIR REFRIGERATION SYSTEMS

The War Production Board has amended preference rating order P-126 for the purpose of facilitating the acquisition of material for the emergency repair servicing of industrial and commercial refrigerating or air conditioning systems. Preference ratings are assigned to deliveries of such material on the terms and conditions set forth in the amendment to the order. Among other things under class I for the assignment of preference ratings are the processing, transportation or storage of food and dairy products for the Army or Navy of the United States, the United States Maritime Commission or the War Shipping Administration, and under class II the order relates to deliveries of material for emergency repair service for any system on which depends, among other things, (1) the continued operations of a plant engaged in industrial or commercial processing of food or food products (not including the processing of dairy products on a farm) and (2) the preser-

vation of blood plasma, pharmaceuticals or foods in a hospital and the transportation or storage of food and dairy products except in establishments selling or serving food at retail, and except for domestic storage.

FUNDS FOR PURCHASE OF FOREIGN BODY LOCATORS

The junior members of the National Society Daughters of the American Revolution have presented a check for \$1,400 to the Bureau of Medicine and Surgery of the Navy for the purchase of instruments to aid in the location of foreign bodies known as the Berman Locator which had previously proved its usefulness in locating embedded foreign bodies and detecting their subsurface depth. The instrument is sensitive, according to the Navy Department, not only to iron and steel but also to silver, copper, aluminum and other metals. The check was presented by Mrs. Hansel D. Wilson of Grosse Pointe Mich., and Mrs. George D. Schermerhorn of Detroit to Rear Admiral Ross T. McIntire, Surgeon General of the Navy, who expressed appreciation of the organization's efforts in sponsoring the project.

AMBULANCES PRESENTED TO THE GOVERNMENT

The Pythian Sisters, Grand Temple of Maryland, conducted a campaign for funds with which five field ambulances were purchased and presented to the United States government in a ceremony at Baltimore on February 13. The Grand Chief of the Maryland branch of this society, Mrs. Pearl E. Klem, who was the leader in the campaign for funds, turned the keys of the ambulances over to Col. Frank P. Strome of the Army Medical Corps representing the Third Service Command. Major Howard W. Jackson made the speech of presentation.

PUBLIC HEALTH UNDER HITLER

According to the *Kaener Zeitung* of Nov. 16, 1942, speculation and illegal trading in medicines had assumed large proportions in Vilna. A number of medicines, including oils of ether, morphine and anesthetics, especially those used for wounded soldiers, have become scarce. The district commissioner reviewed the situation and anticipated in the near future a large collection of medicaments for Germany. The local herb market was widely known and had formerly supplied Germany to a great extent with medicinal herbs. The peasants should cultivate gardens in order to increase production of these plants.

Aftonbladet, Stockholm, of Nov. 17, 1942, reports from Oslo that 600,000 liters of cod liver oil was sent from Norway to Germany during September and October. It is estimated that more than 14,000 tons of cod liver oil has been exported to Germany since April 1941. During the whole period of occupation cod liver oil has been a valuable help to the civilian population, but stocks are now so reduced that only expectant mothers and children can get 1 teaspoon daily.

As stated in the *Klinsche Zeitung* of Nov. 25, 1942, at a meeting of the Cologne Society for Anthropology, Dozent Dr. Bauermeister of the University of Cologne spoke on genetic-biologic tests to determine parentage. Last year in the Cologne Institute alone about 3,000 people were examined. Here the foundations for a race biology of the Rhineland were laid. An examination of similarities between parents and child the decisive factor in the determination of parentage, is made by comparing three to four thousand hereditary characteristics which are recorded either by photography or by drawing. As a rule the mother-child relationship does not need any examination, it is rather the search for the father which is the object of all investigations. The less similarity a child has to its mother the more certain will be the verdict as to the father. In 1,200 cases examined in Cologne the proportion of cases in which science was not able to pronounce a verdict was 4 per cent, the number of absolutely certain cases against which even an oath could be disregarded was 5 per cent, the number of probable cases was 15 per cent, the number of very probable ones was 55 per cent and the number of most probable cases was 21 per cent. The speaker pointed out that the damage which would result if this question of parentage was to be left undecided would be much greater than the harm done in a case in which a wrong decision is made. Such cases are rare. At a time like the present, when millions of foreigners are working in the reich, genetic-biologic control is of an importance which could not be overrated.

A review of what has been done for young and expectant mothers is given in *Le Pays Reel* of Nov. 28, 1942. It states: "From the fourth until the sixth month of pregnancy, expectant mothers can get an extra ration of 14 bread coupons and 24 milk coupons per rationing period. Later until the birth they get an extra 14 bread coupons, 14 meat coupons and 30 milk coupons for each rationing period. The same rations can be had by young mothers for a period of two months after the birth of a child. After that they are entitled to only 30 milk coupons. From the fourth until the sixth month after the birth they can get 12 milk coupons per rationing period. The young and expectant mother will also get an egg card. This card will be valid six months before and six months after the birth. One egg a week is to be had on this card. The baby itself gets—apart from the normal rations—26 milk coupons per rationing period."

"Special regulations have also been issued for textile articles for both mothers and babies. Some people have doubted the value of these coupons because they said that one could not purchase the articles. We have learned, however, that all the articles can be bought without difficulty. There were some difficulties only with diapers, but this condition has improved since special shops have been appointed for the sale of these."

"Young mothers get an extra textile card containing 150 points and coupons for special articles such as bed covers, provided the birth of the child takes place at least three years after the previous child."

According to *Stefan* of Dec. 19, 1942 the cabinet has decreed the civil mobilization of doctors and pharmacists and, in general, of all persons carrying out health services.

DNB of Dec. 18, 1942 reports that following an agreement between the reich leader of the DAF, Ley, and the reich health leader, Conti, the health office of the DAF and the Association of German Panel Doctors have arranged for the district doctors to hold consulting hours in armament factories, supplementing the medical service provided by the works themselves. Thus armament workers will be able to undergo medical treatment in the works without having to waste time by going to the doctor and waiting there. Loss of working hours and output will thus be avoided. As a rule the works doctor will act for the district doctor, and the worker who has been certified as unfit for work will continue to be treated by his panel doctor.

Klinsche Wochenschrift, Berlin, Dec. 5, 1942, reports from the *Deutsche Militärarzt*, 1942, that German soldiers who have been sent to hygienically backward countries where the incidence of syphilis is high sometimes acquire extragenital syphilitic infections through the use of dirty and contaminated eating and drinking utensils.

According to *Kis Ujsdag* of Dec. 20, 1942 the minister of education has, in agreement with the university authorities, reduced the period of study for medical students by one year. This has been done in order to remedy the shortage of doctors.

The worst scarlet fever epidemic ever known is at present afflicting West Prussia, according to *Pohlnken* of Dec. 20, 1942. Entire families are being infected, and Marien hospitals are overcrowded. The cases are often followed by complications for instance kidney trouble and inflammation of the middle ear.

A recent edition of the *Petit Parisien* states that the services of the secretariat of state for health have been worried lately by a recrudescence of cases of venereal disease. To put a stop to this measure will soon be taken by Dr. Grasset. Antivenereal disease clinics are to be modernized and their mechanism improved in coming months. Antepartum consultations and the examination of nursing infants will be supervised by specialists in order to prevent the development of hereditary syphilis. A decree is about to be signed by the marshal which will make it obligatory for any persons having contracted a venereal disease to undergo treatment in a clinic of their own choice or under their usual doctor. This obligation will imply a further measure, namely the declaration by the doctor of each new case of venereal disease observed by him. If the diseased person agrees to be treated normally, this declaration will remain anonymous. On the other hand, if the diseased person should either neglect or refuse to undergo treatment the doctor will be obliged to declare the name of the diseased to the sanitary authorities.

According to *Transocean* of Dec. 30, 1942 the sterilization of persons whose children are bound to be weak in body and mind has now been rendered possible in Norway by law, it was announced in Oslo on December 30. The law further provides for the sterilization of criminals if it is considered likely that they will repeat the same criminal actions. In all cases the decision lies with the director of public health.

Rome Radio of February 12 stated that in application of the laws on the control of citizens in time of war, the national labor service center has ordered the federal labor service centers to take a census of all doctors and to call up for checking purposes all male doctors born in 1914, 1915 and 1916. The doctors will present themselves, if resident in the capital of the province, at the federal labor service center and, if resident in other communes at the respective labor service recruiting centers which are set up in each fascio. They must be provided with identity papers and make a written declaration containing all particulars asked. Those who fail without reasonable cause to present themselves at the labor service centers will be reported to the judicial authorities.

According to *Dagens Nyheter*, Stockholm, of February 5, the recent extremely difficult food situation has brought protective vaccination against tuberculosis into the limelight. A definite increase has not so far been observed in the number of cases, but from various parts of Norway more serious individual cases are reported, therefore preparations have been made for voluntary mass vaccination throughout Norway. The Norwegian National Union Against Tuberculosis voted a large amount for the purpose, and local unions are to supervise the campaign. Sufficient vaccine is available.

ORGANIZATION SECTION

REPORTS OF OFFICERS

NOTE—At the 1925 session of the Association, the House of Delegates suggested that all reports of officers, committees, etc. and resolutions to be brought before the House, if available, be published in advance of the session so as to permit careful consideration and discussion—Ed

REPORT OF THE SECRETARY

To the Members of the House of Delegates of the American Medical Association

The following annual report of the Secretary is respectfully submitted

MEMBERSHIP

As of April 1, 1943 the official membership list of the American Medical Association carried 122,741 names. This number represents an increase of 2,040 over the number of members enrolled on the same date in 1941. The continuous growth of the Association's membership would seem to constitute a rather definite refutation of the charge sometimes made during the last few years to the effect that the Association has lost the support of a large part of the medical profession and that it does not officially represent the views and desires of the physicians of the nation. Such charges have emanated in most instances from sources entirely outside the profession itself. It is true that there are those within its own membership who are not wholly in accord with all its policies and who do not altogether approve some administrative methods, but that is a wholesome sign. Constructive criticism is helpful in any democratic organization, and it is a matter for congratulation and for thankfulness that the principle of free speech and independence of thought and individual conviction is still alive in the hearts and minds of our people, including the members of this Association.

It may be highly significant that within the last ten years the Association's membership has grown from 97,111 on April 1, 1933 to 122,741 on April 1, 1943 and in five years from 109,435 to the present number. The increase in membership is believed to be larger in proportion than the increase in the number of physicians resident in the United States.

In accordance with long established precedent, there appears as a part of this report a table designed to indicate the number of constituent associations and component societies, the number of physicians in each state and territory, the number of members in each major jurisdiction and other statistical data.

FELLOWSHIP

The number of names enrolled on the Fellowship roster as of April 1, 1943 was 72,851. The decrease of 896 from the enrollment on April 1, 1942 is explained by the fact that many Fellows called to active duty with the armed forces have resigned or have permitted their Fellowship to lapse because of uncertainties created by the war. However, a very considerable number of members have qualified as Fellows for the first time, and many of those who are now serving as medical officers have maintained Fellowship.

CANCELLATION OF ANNUAL SESSION

Because of conditions growing out of emergencies created by the war, the Board of Trustees, after thorough consideration of the many factors involved and by unanimous vote, decided that it would be advisable to cancel the annual session of the Association scheduled to be held in San Francisco in 1943. Announcement of this action was made several months ago and the decision apparently has met with general approval.

INSTALLATION OF THE PRESIDENT

While there will be no meetings of the Scientific Assembly in 1943 a general meeting will be held in the Ball Room of the Palmer House on the evening of Tuesday, June 8 at which the President-Elect, Dr. James E. Paullin will be installed as President of the American Medical Association.

REAPPORTIONMENT OF DELEGATES

Section 3 of chapter I of the By-Laws of the Association, which provides for a reapportionment of delegates every third year, reads as follows:

SEC 3. APPOINTMENT OF DELEGATES.—At the annual session of 1925 and every third year thereafter the House of Delegates shall appoint a committee of five on reapportionment of which the Speaker and the Secretary shall be members. The committee shall apportion the delegates among the constituent associations in accordance with article 5 section 3 of the Constitution and in proportion to the membership of each constituent association as recorded in the office of the Secretary of the American Medical Association on April 1 of the year in which the apportionment is made. This apportionment shall take effect at the next succeeding annual session and shall prevail until the next triennial apportionment whether the membership of the constituent association shall increase or decrease. (As amended 1925)

The last apportionment was made at the annual session held in New York in 1940. A new apportionment is due to be made at this session of the House of Delegates.

The Judicial Council, complying with instructions of the House of Delegates and after careful study of the provisions of the Constitution pertaining to the organization of the House of Delegates and of the provisions of the By-Laws pertaining to the apportionment of delegates, submitted in official report to the House at the 1942 annual session. In this report the Council stated its conclusions and offered the recommendation

(1) that the Constitution article 5 section 2 be amended to make delegates elected by the sections of the Scientific Assembly ex officio delegates without the right to vote or (2) because of the number of members of the Association now in government service and therefore unlikely to wield influence on their representation in this House of Delegates that all action be postponed and the reapportionment in 1943 be made under the present constitutional provisions.

The part of the report of the Judicial Council pertaining to apportionment of delegates was referred to the Reference Committee on Sections and Section Work. In its report to the House the Reference Committee proposed an amendment to the Constitution which is reproduced in the next section of this report of the Secretary. The Reference Committee also offered the following recommendation:

Since it is necessary for this amendment to lie over until the next annual session your reference committee also recommends the adoption of the second or alternative recommendation of the Judicial Council that because of the number of members of the Association now in government service and therefore unlikely to wield influence on their representatives in this House of Delegates the reapportionment in 1943 be made under the present constitutional provisions.

The recommendation of the Reference Committee on Sections and Section Work was adopted by the House of Delegates.

PROPOSED AMENDMENT TO THE CONSTITUTION

The Reference Committee on Sections and Section Work submitted the following proposed amendment to the Constitution, article 5, section 2, to the House of Delegates at the annual session of the House held in 1942:

Amend article 5 section 2 of the Constitution by adding after the word Councils the words and the delegates elected by these sections of the Scientific Assembly so that the section reads as follows:

SEC 2.—COMPOSITION.—The House of Delegates is composed of delegates elected by the constituent associations and by the sections of the Scientific Assembly and of delegates from the Medical Departments of the Army and the Navy and the Public Health Service appointed by the Surgeon General of the respective departments. The Trustees the ex Presidents of the Association the members of the several Councils and the delegates elected by these sections of the Scientific Assembly shall be ex officio members of the House of Delegates without the right to vote provided that members of the Councils who are also elected delegates may exercise all the rights of elected delegates.

In accordance with the provisions of the Constitution, this proposed amendment is respectfully presented.

CORRECTION OF THE MINUTES

On page 68 of the printed Proceedings of the House of Delegates the minutes of the 1942 session of the House are made to show that Dr Arthur J. Bedell had signed the report of the Reference Committee on Sections and Section Work. The Secretary has been informed that Dr Bedell did not attach his name to the report of the reference committee and wishes to have the minutes corrected accordingly.

ANNUAL CONFERENCE OF SECRETARIES AND EDITORS OF CONSTITUENT STATE MEDICAL ASSOCIATIONS

The Annual Conference of Secretaries and Editors of Constituent State Medical Associations was held in Chicago in November 1942. These conferences have been held annually for many years except when some emergency has arisen to prevent. On most occasions nearly all state secretaries and editors of state medical journals have attended, and a constantly increasing number of other officials of state and county medical societies have been present at each of the conferences in the last several years. Members of the Board of Trustees and of the Association's administrative personnel also attend.

The programs of the conferences held in 1941 and 1942 were largely given over to discussion of matters pertaining to war service in which the Surgeon Generals of the Army, the Navy and the Public Health Service, the Director of the Selective Service System and the Federal Security Administrator, or their official representatives, have served as leaders. The Secretary is very sure that he expresses the sentiment of all members of the conferences in extending thanks to those officials who have so graciously and generously given of their time and effort to bring authentic and helpful information to the members of the conferences. Thanks are due also to others who have contributed to the conference programs and are herewith offered.

MEMORIALS AND RESOLUTIONS

Up to the time when this report is being prepared, no memorials or resolutions have been submitted to the Secretary for inclusion.

AND AGAIN

Even though it may be done in the same old words the Secretary offers in expression of his heartfelt thanks and grateful appreciation for the many kindnesses extended to him by the members of the House of Delegates by the officers and members of official bodies of the Association and of state and county medical societies and by those with whom he is associated in the Association's offices.

Respectfully submitted

OTTO WIST, Secretary

REPORT OF THE BOARD OF TRUSTEES

To the Members of the House of Delegates of the American Medical Association

The following annual report of the Board of Trustees to the House of Delegates is respectfully submitted.

Participation in the War Effort

For more than two years the official and administrative personnel of the American Medical Association and of its council bureaus and departments have been actively engaged in efforts designed to contribute to the success of the nation's war program. Members of all the Councils, the members of the Board of Trustees and the administrative personnel in practically every department have served in various capacities on committees or commissions of official standing in Washington or in other ways have been directly concerned with one or another phase of the war effort and in some instances have devoted a large part of their time to such service. Official representatives of the Association have on numerous occasions been called on to participate in official conferences held in Washington and have attempted in that connection and in many other ways to be as helpful as possible to the federal government.

It has been necessary to make certain phases of the work of some departments secondary in order that the greatest possible contribution might be made toward the successful prosecution of the war. The number of male employees of the Association fully eligible for war service has been comparatively small. At the time of the preparation of this report thirty-five employees of the Association including members of its professional staff as well as workers in other capacities have been assigned to active duty with the military forces. Five young women of the Association's personnel have been assigned to duty with the Women's Army Auxiliary Corps, and others are contemplating entering on a similar service.

A suboffice of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians was established some months ago in the headquarters of the Association and is now operating intensively under the direction of Lieut Col H C Lueth of the Medical Corps of the Army of the United States. Practically all persons engaged in this particular work are Civil Service employees. This suboffice is engaged in compiling material for the use of the Procurement and Assignment Service and for the use of the Army, Navy, Public Health Service and other government agencies that may wish to utilize such data and is otherwise pursuing activities designed to be helpful to the government, to the civilian population and to the medical profession as a whole in its relations to the war program.

Many official releases from various federal offices have been published in *THE JOURNAL*, and several large mailings of informational material have been made from the offices of the Association at the request of responsible officials of government departments.

Thousands of individual communications from physicians and laymen pertaining to medical service with the military forces or to conditions created by the world war have poured in to the Association's offices and whenever possible and permissible, these communications have received careful attention and replies intended to be helpful to those concerned.

In order that the members of the House of Delegates may be informed as to the specific nature of some of the services that have been performed by officers, members of official bodies and the administrative personnel of the Association in connection with the war program of the federal government, the following information is offered.

The President of the American Medical Association, Brig Gen Fred W Rankin, Medical Corps, Army of the United States, has been on active duty assigned to the Office of the Surgeon General in Washington for more than a year. The President-Elect, Dr James E Paullin is a member of the Directing Board of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians and is also a member of one or more committees of the Division of Medical Sciences of the National Research Council. Dr Harvey B Stone a member of the Council on Medical Education and Hospitals, is a member of the Directing Board of the Procurement and Assignment Service. Members of the Council on Pharmacy and Chemistry, the Council on Physical Therapy, the Council on Foods and Nutrition and the Council on Industrial Health are members of important scientific committees working under government auspices in Washington, and some of them are serving in other capacities.

The executive officers of all the Councils and the Directors of all the Bureaus of the Association have attempted whenever opportunity has offered to be helpful to government departments and bureaus in various matters pertaining to war service. Dr Paul C Barton, Director of the Bureau of Investigation and assistant to the Secretary, has been on duty in Washington for about four months. In compliance with requests received from several official agencies of the government the facilities of the Association have been used for the purpose of distributing rather large quantities of informative material.

Under the direction of the Editor of *THE JOURNAL*, a scientific news letter is prepared every two weeks which is sent under the auspices of the Committee on Information of the Division of Medical Sciences of the National Research Council to medical officers of the Army, Navy and Public Health Service. For the Navy, this material is incorporated in a fortnightly letter issued under the title 'Bumed,' and this letter, in accordance with a special request, is being sent also to the air force of the Canadian army and is issued to the medical officers of that force. The Editor of *THE JOURNAL* also serves as consultant to various offices and committees in Washington and is a member of a committee on drugs and medical supplies of the Division of Medical Sciences of the National Research Council and vice chairman of the Medical Committee of Civilian Defense for the City of Chicago.

The Library of the Association, with the cooperation of the Editorial Department, has assembled material relating to health conditions in various parts of the world for a division of the medical department of the U S Army. Through the Cur-

rent Medical Literature Department bibliographies and abstracts concerned especially with problems of military medicine have been prepared and submitted to federal agencies. From these abstracts collective reports and reviews are prepared which are published subsequently in *WAR MEDICINE*. A member of the editorial staff has directed the preparation of abstracts issued fortnightly covering progress in medical science for an important government office, and these abstracts are circulated in mimeographed form by that office in a manner that makes the material available in many parts of the world. Some of this material has been republished in periodicals in several countries. The director of the Department of Press Relations is serving as a member of committees or subcommittees of official government agencies in Washington and in somewhat similar capacity for the Emergency Medical Services of the Office of Civilian Defense in Chicago.

The Association has attempted to make the greatest possible contribution toward the winning of the war, and the Board of Trustees has authorized the active participation of the Association's administrative personnel in efforts designed to accomplish that end. In extending such cooperation to the government the Association has received most valuable aid from government officials and desires to express its grateful appreciation of many courtesies graciously extended and for valuable assistance and cordial cooperation offered by those officials.

Income and Expenditures

It was expected that during the period covered by this report the income of the Association would be adversely affected by conditions growing out of the prosecution of the war, but such expectations were not realized. In accordance with long established precedent the Report of the Treasurer and the Report of the Auditor for the year ended Dec 31 1942 are submitted as a part of this report of the Board of Trustees.

Gross income from all sources for the fiscal year covered by this report amounted to \$1,975,236.30, an increase of \$36,108.91 over the amount of gross income as reported for the year ended Dec 31 1941. Total expenditures for the year ended Dec 31 1942 amounted to \$1,644,820.96, a decrease of \$70,958.79 from the total expenditures in the preceding year.

Income received from Fellowship dues and subscriptions amounted to \$804,319.66, which exceeds the income received from the same source in 1941 by \$8,859.18. It was stated in the report of the Board of Trustees submitted to the House of Delegates at the last annual session that income from Fellowship dues and subscriptions would in all probability be materially reduced in 1942, and it is gratifying indeed to be able to report to the House of Delegates that such receipts actually increased over comparable receipts for the preceding year.

Receipts from the sale of advertising space in *THE JOURNAL* amounted to \$1,036,571.59, representing an increase of \$26,717.63 over similar income for the year 1941.

The interest received on investments in 1942 amounted to \$74,482.58 as compared with receipts from a similar source in 1941 of \$77,424.09. There has been a continuous decrease in the amount of interest realized on the Association's investments during the past several years, explainable by the fact that interest rates and especially those applicable to many of the most dependable securities have been rather radically scaled downward and by the further fact that because of somewhat revolutionary changes in the issuance and distribution of such securities the difficulties involved in making satisfactory investments have been greatly intensified.

The net income for the year as shown in the Report of the Auditor which appears as an appendix to this report, was \$330,415.34, of which sum \$74,482.58 represented interest on the Association's investments.

The cost of paper used in the publication of *THE JOURNAL* in 1942 was \$262,682.14, representing an increase of \$2,491.15 over a similar expenditure for the year 1941. The price of practically all the paper used by the Association has been considerably increased, but the full effect of such increase is not shown in this item of expense for 1942, partly because stock in hand at the end of the preceding year was used during the year covered by this report. Restrictions placed on the pro-

duction of paper and on the use of this material by publishers has made it necessary to reduce the size of some of the Association's publications and to resort to other procedures in order that the allotment made under the rulings of the War Production Board shall not be exceeded. Lighter weight paper stock will be used in *THE JOURNAL* and in *HYGEIA* wherever possible, and the amount of printed material on each page of the special journals will be increased by cutting down the page margins. It is possible that if the war continues over any considerable period of time and if certain conditions incident to the war are deepened rather than improved, additional restrictions may be placed on the production and distribution of paper used by publishers. There is also a possibility that the cost of paper will increase rather than diminish.

Expenditures for wages and salaries reported in *THE JOURNAL* account in the Report of the Auditor for the year ended Dec 31, 1942 amounted to \$548,302.57 as compared with similar expenditures in 1941 of \$540,800.30. Because of higher living costs, it has been necessary to adjust the salary and wage scale, and further adjustments will have to be made. The total amount expended for wages and salaries in 1942 would have been somewhat larger except for the difficulties involved in maintaining adequate working personnel.

Expenditures incident to the operation of the various councils, bureaus and departments of the Association, including salaries and wages, amounted to \$467,974.57 in 1942, an increase of \$7,460.99 over similar expenditures in the preceding year.

Expenses under the heading Legal and Investigation Expense for 1942 amounted to \$64,449.71 as compared with \$119,183.19 in 1941. By far the larger part of expense incurred in this connection in 1941 was incident to the costs involved in the trial of the case of the United States of America versus the American Medical Association and the Medical Society of the District of Columbia et al and in expenses involved in appeals to higher courts from the decision rendered by the trial court.

The Association's buildings and equipment have been well cared for, and special care has been taken to maintain in good working order all machinery used in the publication of periodicals or required for the maintenance of buildings. During the year the inside walls of the main building were repainted or otherwise refurbished.

The number of employees of the Association at the time of the preparation of this report was 561.

Summary

Gross income from all sources for the year 1942 amounted to \$1,975,236.30, an increase of \$36,108.91 over the preceding year. Total expenditures for the year were \$1,644,820.96, which was less than the total expenditures during 1941 by the sum of \$70,958.79. Income received from Fellowship dues and subscriptions amounted to \$804,319.66, exceeding income from the same source in 1941 by \$8,859.18. Receipts from the sale of advertising space in *The Journal* were \$1,036,571.59, representing an increase of \$26,717.63. Interest received on investments in 1942 amounted to \$74,482.58 as compared with similar income in the preceding year of \$77,424.09. There has been a continuous decrease during the past several years in the amount of interest realized from the Association's investments. Net income for 1942 was \$330,415.34. The cost of paper used in the publication of *The Journal* amounted to \$262,682.14 during the past year, an increase of \$2,491.15 over similar expenditure in 1941. Expenditures for wages and salaries as reported in *The Journal* account for the year ended Dec 31, 1942 were \$548,302.57 as compared with expenditures on the same account in the preceding year of \$540,800.30, and expenditures incident to the operation of the various councils, bureaus and departments of the Association, including salaries and wages, amounted to \$467,974.57, an increase of \$7,460.99 over similar expenditures in 1941. Legal and investigation expense for 1942 was \$64,449.71 as compared with \$119,183.19 in the preceding year. At the time of preparation of this report there were 561 persons in the employ of the Association.

The Journal of the American Medical Association

The impact of the war, including enrolment in the armed forces of more than 45,000 physicians, has been recognized by special consideration given in *THE JOURNAL* to problems of military medicine and to official announcements related to the war effort. The department of *THE JOURNAL* devoted to "Medicine and the War" has regularly published for the benefit of the medical profession the official announcements of the U S Army Medical Department, the Bureau of Medicine and Surgery of the Navy, the Office of Civilian Defense, the United States Public Health Service, the Office of War Information, and those sections of the government concerned with the control of foods, drugs and medical supplies. Each of these government agencies has acknowledged in written communications the service rendered by *THE JOURNAL*, as the voice of American medicine in the coordination of the medical profession for the war effort.

In its editorials *THE JOURNAL* has aided the war effort by participation in the recruitment of physicians for the innumerable activities which they are called on to perform at this time.

The content of *THE JOURNAL* has been somewhat modified by the cancellation of many scientific medical meetings which used to be a source of scientific contributions. Nevertheless the prestige and the circulation of *THE JOURNAL* have served to make it first choice for submission of voluntary manuscripts, so that there is not a dearth of papers.

An arrangement has been made with the Council on Scientific Assembly and the officers of the scientific sections to prepare scientific programs just as if the annual session of 1943 were to be held. These manuscripts will then be submitted to a selected group of authorities who will present written discussions, these in turn being submitted to the original authors for closing discussions. It is believed that this method of development of material will serve a most useful purpose in keeping readers of *THE JOURNAL* abreast of scientific advances during the war period.

The war continues to interfere seriously with the receipt of correspondence and medical periodicals from foreign countries. The arrangements that have been made to cooperate with the Latin American nations are gradually being perfected so that correspondence is being received more frequently from our South American neighbors. Through arrangement with the government archives, microfilms of scientific periodicals published abroad will be received for abstracting in the periodicals of the Association and for indexing in the *QUARTERLY CUMULATIVE INDEX MEDICUS*.

The Organization Section of *THE JOURNAL* has served fully to inform the members and Fellows of the Association concerning the activities of various councils and official agencies of the Association and the work of the Board of Trustees and similar groups. Through this section also the reports of the Bureau of Legal Medicine and Legislation and of the Bureau of Medical Economics are given wide circulation.

Significant among the special articles published during 1942-1943 is the series on nutrition, developed under the auspices of the Council on Foods and Nutrition and planned ultimately for circulation as a book to be called "The Handbook of Nutrition."

THE JOURNAL is attempting to cooperate with the War Production Board in reducing the total amount of paper used during the year by 10 per cent. Conceivably the demands made on *THE JOURNAL* for the services it may render in the war effort may make it difficult to continue to comply with this demand. The situation has been placed before the representatives of the War Production Board.

There was a slight decrease, due entirely to war conditions, in the number of subscribers to *THE JOURNAL* during the year. On Dec 31, 1942 there were 103,692 names on the mailing list of *THE JOURNAL* as compared with 104,003 names on the same date in the preceding year, a difference of 311. It is extremely interesting to note in this connection the loss in 1942 of 261 subscribers from the Philippines as well as a decided reduction in the total number of foreign subscribers.

The accompanying table 1 indicates the number of Fellows and subscribers on THE JOURNAL mailing list in each state and territory on Jan 1, 1943 and also shows the number of Fellows and subscribers in other countries, the number of copies sent to advertisers and subscription agents and the number sent as

exchange or complimentary copies. The number of physicians in each state, based on the Seventeenth Edition of the American Medical Directory, the number of physicians in each state who receive THE JOURNAL and the approximate percentage of such physicians are shown in table 2.

The net paid weekly average circulation in 1942 was 101,993 as compared with 100,027 in 1941. The total number of copies of THE JOURNAL printed in 1942 was 5,417,360.

Summary

Throughout the year 1942 special consideration has been given in the columns of The Journal to problems of military medicine and to official announcements related to the war effort. Acknowledgment of the service rendered by The Journal has been received from many government agencies.

Although the content of The Journal has been somewhat modified because of the cancellation of scientific

medical meetings which used to be a source of scientific contributions, The Journal apparently continues to be the first choice for submission of voluntary manuscripts.

A plan has been worked out with the cooperation of the Council on Scientific Assembly and the officers of the scientific sections whereby papers and discussions of them will be available for publication in The Journal during the coming year even though the regular annual session of the Association is not held.

The war continues to interfere seriously with the receipt of correspondence and medical periodicals from foreign countries, but cooperative arrangements are gradually being perfected with the Latin American countries, so that correspondence is being received more frequently from that source.

The Organization Section of The Journal continues to serve fully to inform the members and Fellows of the Association concerning Association activities.

It is conceivable that the demands made on The Journal for the services it may render in the prosecution of the war effort may make it difficult to continue to comply with the restrictions placed on the use of paper by the War Production Board, although up to this time there has been complete cooperation in this connection. The situation has been placed before representatives of the War Production Board.

TABLE 2—Percentage of Physicians Receiving The Journal*

State	Number Receiving Journal	Physicians in A M A Directory	Approximate Percentage Receiving Journal

* This table gives the number of physicians (based on the Seventeenth Edition of the American Medical Directory) in the United States the number receiving THE JOURNAL and the approximate percentage in each state. Copies to physicians in the United States Army, Navy and Public Health Service are not included.

There was a slight decrease, due entirely to war conditions, in the number of subscribers to The Journal in 1942. The net paid weekly average circulation during the year was 101,993, and the total number of copies of THE JOURNAL printed was 5,417,360.

Special Journals

Nine periodicals are included in the group of scientific publications of the Association generally referred to as the "special journals." They are the ARCHIVES OF INTERNAL MEDICINE, the ARCHIVES OF SURGERY, the AMERICAN JOURNAL OF DISEASES OF CHILDREN, the ARCHIVES OF OPHTHALMOLOGY, the ARCHIVES OF PATHOLOGY, the ARCHIVES OF NEUROLOGY AND PSYCHIATRY, the ARCHIVES OF OTOLARYNGOLOGY, the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY and WAR MEDICINE. Each of these journals deals with the special field of medicine indicated by its title, and each has its own editorial board elected by the Board of Trustees. The members of these boards devote a large amount of time and effort to their editorial duties, and the Association can well be proud of the products of their fine service. The contributions to the columns of these periodicals are of high quality, and each of the special journals has won recognition from specialists in many parts of the world.

The newest member of the group WAR MEDICINE has steadily gained favor. Its circulation in its second year increased over that of the preceding year by more than 33 per cent.

Certain special features of some of these journals notably symposiums and reviews in the ARCHIVES OF SURGERY and reviews in the ARCHIVES OF INTERNAL MEDICINE have attracted wide interest. The "Opie Number" of the ARCHIVES OF PATHOLOGY, published in July 1942 received high commendation.

Because of restrictions imposed by the federal government on paper supplies, it became necessary to reduce the number of pages in each of the special journals but this deficiency was minimized to some extent by reducing the width of page margins and widening printed columns.

Five of the special journals were published at a loss of \$16,027.96. Four produced income larger than the cost of publication by the sum of \$11,182.63, these four being the AMERICAN JOURNAL OF DISEASES OF CHILDREN, the ARCHIVES OF OTOLARYNGOLOGY, the ARCHIVES OF OPHTHALMOLOGY and WAR MEDICINE.

Total circulation of the nine special journals in 1942 was 28,880 as compared with a circulation of 28,576 in 1941. However, four showed decreases, varying from 45 for the ARCHIVES OF OTOLARYNGOLOGY to 320 for the ARCHIVES OF INTERNAL MEDICINE. Gains in circulation were recorded for WAR MEDICINE, the ARCHIVES OF OPHTHALMOLOGY, the ARCHIVES OF DERMATOLOGY AND SYPHILOLOGY, the ARCHIVES OF NEUROLOGY AND PSYCHIATRY and the ARCHIVES OF PATHOLOGY.

Hygeia

The increasing success of HYGEIA is reflected in its circulation and its importance as a medium for the advertising of materials related to health. In some areas HYGEIA is relied on for providing collateral reading in courses of science in schools. Its feature articles and its editorials have had large circulation through repetition in the press. Outstanding as a part of its service in the war effort have been the special articles related to foods and nutrition, to industrial health and, particularly, to the health problems of women in industry. HYGEIA has served, moreover, to inform the public regarding the health aspects of military service.

The average net paid circulation of HYGEIA for the twelve months of the fiscal year was 111,021. In December 1942 the number of physicians on the subscription list was 15,017.

From a financial standpoint, 1942 was HYGEIA's best year. Substantial gains were recorded for both subscription and advertising income with the result that there was a net gain of \$40,376.34 from the year's operations.

The Woman's Auxiliary to the American Medical Association has continued its interest in HYGEIA and has been very helpful in maintaining its circulation. A past president of the Auxiliary was instrumental in securing the renewal of more than 800 subscriptions to HYGEIA for use in junior and senior high schools in Pennsylvania.

Library

The Library of the American Medical Association distributed 2,466 library packages in 1942, approximately 20 per cent of which were sent to governmental agencies, including army and marine hospitals and naval training stations. Requests for library packages were received and filled from every state in the Union. While it has proved impractical to extend the package service outside the continental United States, requests were received from Hawaii, Mexico and the Canal Zone and owing to the urgency of the requests, service was extended to those points. Requests for subjects dealing with war and military medicine including air raids and gas warfare led all other requests for 1942. Other subjects popular in 1942 were aviation medicine, sulfanilamide, industrial medicine, heart disease, blood transfusion, treatment of burns and virus pneumonia.

During the year 12,267 periodicals were sent out through the Library's periodical lending service and approximately five thousand requests for references were received and filled.

Indexes for the three volumes of THE JOURNAL were prepared as usual in the Library.

Members of the Library staff assisted the Abstracting Department in the preparation of abstracts for members of committees of the National Research Council. The principal subject covered were bacteriology of burns and wounds, blood substitutes, cardiovascular diseases, head injuries, healing of fractures, experimental malaria, malaria therapy, military psychiatry, peripheral nerve injuries, shock and thrombophlebitis.

Continuing the policy of maintaining only a ten year collection of periodicals, periodicals covering the year 1930 were distributed during the year to fifty-five libraries through the Medical Library Exchange.

The Employees Library, which makes books and magazines available to employees of the Association for an annual fee of 50 cents, circulated 4,107 books in 1942.

Quarterly Cumulative Index Medicus

Because of conditions created by the global war comparatively few publications from foreign countries have been available for indexing during the past two years. Only 13,424 articles from such publications were indexed in 1942, a large percentage of which were from Spanish and Portuguese journals, whereas in 1940 there were 26,614 such articles. It is expected that arrangements may be made in 1943 for indexing 1942 material in much larger amount.

The cost of publication of the INDEX MEDICUS for 1942 because of the dearth of material available for indexing was greatly reduced and the loss sustained from its publication was considerably less than in previous years. Expenditures exceeded income from subscriptions and sales by the sum of \$27,337.94 for the year 1942.

American Medical Directory

The preparation and publication of the Seventeenth Edition of the American Medical Directory was greatly delayed because thousands of physicians were assigned to duty with the military forces after the preliminary work was far advanced. It was necessary to make a great many changes in listings. Much time was lost also because of the difficulty encountered in maintaining adequate personnel. Because of the acute shortage of competent clerical help and of supplies as well as because so many physicians are serving as medical officers, it is doubtful that it will be possible to publish another edition of the American Medical Directory at the regularly scheduled time in 1944.

The style of the Seventeenth Edition is practically the same as that of the previous edition. Symbols have been used to designate physicians serving with the military forces. The new Directory contains 201,272 names, as compared with 195,104 names in the Sixteenth Edition, and is larger by 122 pages.

The net loss for the Seventeenth Edition as of Dec. 31, 1942 amounted to \$12,338.66, a sum in excess of the loss on the previous edition by \$3,399.40.

In common with practically every department of the Association the Directory Department has cooperated to the full, to possible extent with the Procurement and Assignment Service.

and has been of material aid to that service and to other branches of the federal government in supplying and checking information concerning many thousands of physicians.

Mailing and Order Department

The total number of pieces of outgoing first and third class mail handled through the Mailing Department in 1942 was 2,446,130, as compared with 2,582,248 in the previous year. For transmitting this mail 4,177,739 envelopes of all kinds were used. A large amount of first class mail was sent from the Association's offices during the year that was not handled through this department.

The Order Department handled 73,415 orders in 1942 involving the distribution of 355,309 items, an increase over the previous year of more than 1,400 orders.

The records of the Mailing and Order Department show that 5,946 mail bags containing 181.4 tons in average weekly weight of 3 1/2 tons of second third and fourth class mail were used. This tonnage does not include the mailing of current weekly and monthly issues of the Association's publications which in 1942 amounted to approximately 3,160 tons, or a weekly average of 60.7 tons involving the use of 125,182 mail bags during the year.

Cooperative Medical Advertising Bureau

The Cooperative Medical Advertising Bureau continued in 1942 to serve thirty-five of the official publications of constituent state medical associations.

Commissions earned by the Bureau during the year ended Dec. 31, 1942 amounted to \$42,681.71 which represents the Bureau's most successful year. The expense incident to the operation of the Bureau was \$14,751.55. Cash discounts allowed in excess of cash discounts received were \$1,930.16 and commissions remitted to state journals at the end of the year in proportion to the total amount of advertising secured for each cooperating journal amounted to \$26,000.

Press Relations

The increasing recognition resulting from the nation's war effort of the importance of health is reflected in the press relations activities of the Association which are carried on under the supervision of the Editor of *THE JOURNAL*. Particularly important in the operations of this department during the past year was the extension of its information service through the medium of the *AMERICAN MEDICAL ASSOCIATION NEWS* to a large and constantly increasing number of house organs of industrial firms throughout the United States and Canada. The number of mediums through which the Association is reaching the farmers of the nation also was increased extensively during the year.

Typical of the comments being made about the public relations activities of the Association is the following statement which appeared in an editorial in a recent issue of the *Michigan Legal Record*: "It isn't exactly illegal to besmear the general character of the medical profession. But it just isn't done because facts are continually placed before the public concerning the activities carried on by physicians to better the public health. This barrage of information is supplied by the national organization of the profession and all down the line through the state and county society."

Although news space in the newspapers of the country is being drastically reduced because of the paper shortage due to the nation's war activities the number of stories based on articles appearing in *THE JOURNAL* and *HYGEIA* during 1942 totaled more than eighty-three thousand, an increase of almost two thousand over the number in 1941. In addition an increasing number of feature stories and editorials based on information furnished by the Association appeared in the daily press and in popular magazines. The use by radio stations of information furnished by the Association also continued to increase during the year.

The mailing list of the *AMERICAN MEDICAL ASSOCIATION NEWS* includes three hundred and nineteen daily newspapers,

six papers on the mailing list having been suspended during the year, eighty-three news services radio stations and miscellaneous publications, thirty-seven local and state health departments fifty health and tuberculosis associations seventy-nine county and local medical societies, fifty-three state and territorial medical societies, eighty-five national medical organizations fifty-eight pharmaceutical companies and associations, sixty-four industrial organizations, nineteen educational institutions twenty-four science writers and eighty miscellaneous publications and organizations. Fifty-five copies of the *AMERICAN MEDICAL ASSOCIATION NEWS* are sent weekly to various constituent state and territorial medical associations for distribution to small newspapers in their areas.

Indicative of the importance of the Association as a source of information was the fact that all the press associations and several of the nation's leading newspapers sent their science editors and reporters to cover the Atlantic City session. In some instances the papers sent more than one staff member to cover the session. A large number of stories pertaining to the Atlantic City session appeared prior to and during the meeting in the newspapers of Central and South America. These papers also are using throughout the year an increasing number of stories based on releases prepared by the Association.

The number of inquiries regarding various phases of medicine received in the Press Relations Department from newspapers radio stations and other mediums of public information continued to increase in 1942. During the year these totaled more than three thousand eight hundred as compared with approximately three thousand one hundred in 1941 and two thousand in 1940. Inquiries pertaining to various medical phases of the war were responsible for a portion of this increase.

During 1942 the facilities of the Department of Press Relations were being used increasingly by various governmental agencies and other organizations particularly in connection with the nation's war effort. This was particularly true in regard to matters pertaining to industrial health to the procurement and assignment of physicians for the armed forces and to the nation's civilian medical needs. State and county medical societies continued to call on this department for assistance in their press relations programs. The medical news page appearing in *HYGEIA* each month is furnished by the Press Relations Department.

Council on Pharmacy and Chemistry

The Council on Pharmacy and Chemistry has completed thirty-eight years of service to the medical profession and to the public. During this time the Council has assumed ever increasing importance in the field of medicine until now it is truly considered one of the leading authorities on rational therapeutics. Its rules were adopted originally with the idea of protecting the medical profession and the public against fraud, undesirable secrecy and objectionable advertising in connection with proprietary medicinal articles. As time progressed the function of the Council was broadened, so that it now advises the medical profession concerning the status of medicinal articles, the profession is importuned to use publishes reports on claimed advances in the use of drugs and with the aid of the Chemical Laboratory, elaborates standards for the control and identity of drugs that are introduced into materia medica. During 1942 the Council's observance of these principles and its leadership in medicine rose to a new peak.

CONTRIBUTION TO THE WAR EFFORT

The Council has contributed directly and indirectly to the prosecution of the war effort. It has provided information for physicians in private practice in industry and in the armed forces it has been of service to research centers educational bodies and purchasing agencies and it has cooperated with governmental agencies, regulatory and advisory. The Council has supplied criteria for evaluating drugs to be used in industry and on the battle fields and information on therapeutic procedures, pharmacology toxicology and the actions and uses of drugs and drug substitutes. Among the bodies with which the Council has maintained cooperative relationship are the Army Navy, Public Health Service War Production Board, Office of Emergency Management Office of Price Administration

National Research Council, National Safety Council, Office of Civilian Defense and American Red Cross

Four members of the headquarters office personnel are on active service with the armed forces. One Council member is on active service abroad, and another has spent some months in an allied country conducting a special survey. Most of the Council members are on one or more special committees in active or advisory capacities, of the central bodies which are directing the war effort.

GOOD WILL RELATIONS

During the year the Council on Pharmacy and Chemistry representing the American Medical Association, and the American Pharmaceutical Association sponsored a meeting for discussion of subjects of common interest. The meeting was so well attended and successful that both bodies hope to participate in another conference at an appropriate time.

Cooperative relationships have been established, or furthered with representatives of a number of foreign countries including Canada, England, China, Mexico, Brazil, Ecuador, Peru, Venezuela and Russia.

PUBLICATIONS

During the year, revision of New and Nonofficial Remedies 1942, Useful Drugs and Epitome of the U. S. Pharmacopoeia and National Formulary was completed, and the new editions will be available early in 1943. Fifteen thousand copies of the Council's publications, including New and Nonofficial Remedies Useful Drugs, Epitome of the U. S. P. and N. F. Annual Reprint of the Reports of the Council and Glandular Physiology and Therapy were distributed. The figures for 1942 bring up to 380,000 the number of publications of the Council on Pharmacy and Chemistry which have been distributed over the last twenty year period. Included in this figure are 165,000 copies of New and Nonofficial Remedies, of which 75,000 have been complimentary paper bound copies issued to students in approved medical schools. Publications for which the Council is not solely responsible, such as the A. M. A. Intern's Manual and The Vitamins, are not included in these figures.

RESEARCH

A complete report of the Council's Committee on Therapeutic Research is included in the Addenda to the Report of the Board of Trustees. In brief, twenty-seven new grants were issued during 1942, making a total of sixty-seven grants which were still open at the end of the year. The number of grants that have been issued since the formation of this committee in 1911 is four hundred and ninety-three.

The Council is sponsoring status reports on preparations intended for the prevention and treatment of fungous infections and the treatment of Trichomonas vaginalis infections and of burns, on the antibacterial and anti-infective properties of soaps and commonly included ingredients, on the value of gas gangrene antitoxin and tetanus gas gangrene antitoxin, on metrizol, on tissue stimulants for wound healing and on xanthine derivatives, digitalis and immunization against whooping cough. Some of these investigations have been completed and will be published soon.

EDUCATIONAL ACTIVITY AND OTHER WORK

During 1942 the Council adopted for publication forty-four reports consisting, in part, of statements of a general nature concerning the use of bulk ether in anesthesia, the status of sodium cacodylate, aminoacetic acid and the higher types of antipneumococcus serums, criteria for the evaluation of antibacterial agents and the proper use of vitamins in mixtures, and, in part, the status of compounds such as zinc peroxide, zephiran hydrochloride, bismuth ethyl camphorate, nikethamide, diethylstilbestrol and mecholyl bromide. It also adopted for publication twenty monographs on new drugs and accepted for inclusion in New and Nonofficial Remedies approximately two hundred and fifty drugs, involving over five hundred dosage forms and two thousand five hundred dosages. The Council also gave partial consideration to several hundred other therapeutic agents but did not complete action at the request of the manufacturer pending further investigation or because of insufficient data or submission of the products late in the year.

Although it is impossible to accept all requests for speaking engagements, the Secretary of the Council appeared on several occasions before audiences composed of physicians, chemists, pharmacists, students and others. The Secretary also appeared on several radio programs as a representative of the Council. Tentative plans have been made for a series of exhibits sponsored by the Council on Pharmacy and Chemistry which can be used before medical and lay groups.

ANNUAL MEETING OF THE COUNCIL

During the early part of October the Council held its annual two day meeting to discuss problems which had arisen during the year. The topics discussed included agents used in the prevention and treatment of athlete's foot, the promotion of mixed vitamin preparations to the public, labeling of vitamins used in therapeutic doses, contraceptives, artificial mineral waters, the use of the metric system in Council publications, the scope of New and Nonofficial Remedies, censorship of descriptions of new drugs published in THE JOURNAL and medical pharmaceutical relations. The censorship of Council descriptions of new drugs deserves special mention as the subject arose following discussion with the Office of Censorship and the Board of Economic Warfare. For the duration of the war, statements of description or methods of preparation of new drugs on their original publication in THE JOURNAL will be subject to censorship in the interests of national defense.

MEMBERSHIP

Dr. Austin F. Smith, who has been a member of the Council's staff at the headquarters office for several years, was appointed Acting Secretary of the Council on Pharmacy and Chemistry by the Board of Trustees following the resignation of Dr. Theodore G. Klumpp in December 1941. Dr. Smith now serves as Secretary of the Council.

The tragic death of Dr. Somer Weiss deprived the Council of a prominent member. As a new member Dr. Weiss had served with the Council only a short time, but during that period his abilities as a stimulating teacher, resourceful clinician and brilliant investigator made him one to whom all freely turned for advice and help. During the year Dr. Robert A. Hatcher retired from active membership and, by special action of the Board of Trustees, was made an Honorary Life Member. Dr. Hatcher was one of the two remaining charter members of the Council. His contributions to science and education as well as his attributes as a scholar and scientist are known to all. Dr. Chester S. Keefer of Boston University School of Medicine and Dr. Robert P. Herwick of the United States Food and Drug Administration were appointed to fill these vacancies.

Summary

The Council on Pharmacy and Chemistry has completed thirty-eight years of service to the medical profession. During 1942 the Council increased its contributions to the welfare of the physician and his patient, was of material aid to many agencies of the federal government in the prosecution of the war effort and established and furthered good will relations with representatives of a number of foreign countries. Several members of the Council and of its office staff are on active service with the armed forces, and others are members of special advisory committees which are aiding in directing the health of the civilian population and of the fighting troops.

Revision of several of the Council's publications was completed during the year, and the popularity of these publications appears to be increasing.

By issuing twenty-seven new research grants through the Committee on Therapeutic Research in 1942, the number of grants issued since 1911, when this committee was established, was brought up to four hundred and ninety-three. The Council initiated several status reports on a number of agents and therapeutic procedures which are of vital importance in medical practice.

The Council adopted for publication forty-four reports on the status of certain classes of drugs, twenty monographs on new drugs and accepted for inclusion in

New and Nonofficial Remedies approximately two hundred and fifty drugs including over five hundred dosage forms and two thousand five hundred dosages. Consideration of several hundred other drugs was not completed for one or more reasons.

During the year the Secretary appeared on several radio programs as a representative of the Council and also filled a number of speaking engagements.

At the annual meeting of the Council, topics discussed included prevention and treatment of fungous infections, promotion of mixed vitamins, labeling of vitamin preparations, mineral waters, contraceptives, use of the metric system, scope of New and Nonofficial Remedies, censorship of published descriptions of new drugs in *The Journal* and medical pharmaceutical relations.

Dr Austin E. Smith, who was appointed Acting Secretary following the resignation in December 1941 of Dr Theodore G. Klumpp, was later made Secretary of the Council on Pharmacy and Chemistry. The Council was deprived of two valuable members through the death of Dr Soma Weiss and the retirement of Dr Robert A. Hatcher. Drs Chester S. Keefer and Robert P. Herwick, authorities in their respective fields, have been appointed as new members.

The Chemical Laboratory

The Chemical Laboratory has served the medical profession for over thirty six years. In 1942, as in former years, the primary function of the Laboratory has been the chemical consideration of medicinal products for the Council on Pharmacy and Chemistry. Information concerning the identity, purity and strength of new chemotherapeutic agents is made available to the profession generally through reports of the Council and of the Laboratory published in *THE JOURNAL*.

An important contribution of the Chemical Laboratory in the field of drug analysis during 1942 has been the chemical and physical characterization of the vitamin K active substance menadione bisulfite (2-methyl-1,4-naphthoquinone-sodium bisulfite addition product) and the development of techniques for its isolation, identification and detection in mixtures. Although this information has been accepted for publication in the chemical literature it has not yet been published because of wartime censorship. Another important contribution has been the publication of a method for the detection and quantitative determination of 4-amino-2-methyl-1-naphthol, another synthetic vitamin K.

The Laboratory is equipped with many of the newer types of apparatus which aid in the examination of chemical substances. The space and equipment for macroanalysis and the excellent facilities for microchemical analysis and spectrophotographic examination of materials have been augmented by the installation of a Beckman photoelectric spectrophotometer suitable for the determination of light absorption in both the ultraviolet and the visible portions of the spectrum and of a Coleman photoelectric fluorophotometer useful in the study of certain vitamin mixtures and other fluorescent substances.

WORK FOR THE COUNCIL ON PHARMACY AND CHEMISTRY AND OTHER DEPARTMENTS OF THE ASSOCIATION

Each year the Laboratory is called on by the Council on Pharmacy and Chemistry to examine many of the newer substances being introduced into therapy and to assist in the development of suitable tests and standards by means of which uniformity in composition and action may be assured. In addition to the examination of many other products submitted to the Council in 1942, the Laboratory gave consideration to tests and standards for such substances as vitamin K₁, sulfadiazine, pyridoxine hydrochloride, sulfaguanidine, sulfadiazine sodium, diethylstilbestrol, menadione bisulfite, calcium levulinate, phenarsine hydrochloride, hydroxymercurifuran, phemerol hydrochloride, bismuth ethylcamphorate, aluminum hydroxide gel, aluminum phosphate gel, divalinal sodium, diodrast compound solution, syrup of ammonium mandelate, zinc insulin crystals and succinylsulfathiazole. The Laboratory also served the Council in connection with revision of New and Nonofficial Remedies

1942 and devoted a considerable amount of time to the provision of chemical information in reply to correspondence and to problems of nomenclature.

The Laboratory has continued its cooperation with the Bureau of Investigation in the examination of a number of products sold to the public. The Laboratory staff in the classification of substances under correct chemical designations and has been of assistance to the advertising committee by means of technical advice and a number of laboratory studies.

The Chemical Laboratory continues to enjoy cooperation with the laboratories of the American Dental Association, the U. S. Food and Drug Administration and many manufacturers in the consideration of chemical problems concerning standards for the identity, purity and strength of various drugs.

Summary

The Chemical Laboratory of the American Medical Association has made important contributions, arising from its work for the Council on Pharmacy and Chemistry, in the field of drug analysis. The addition of new equipment maintains its position in the vanguard of well equipped laboratories. The Laboratory has cooperated wholeheartedly with all departments of the Association and with a number of other organizations in the furtherance of its function.

Council on Foods and Nutrition

Throughout the year 1942 the Council on Foods and Nutrition has been in constant touch with developments in the tremendously important food problems that have arisen in connection with the present world conflict and especially with those that concern the feeding of the civilian population. The Council has aided various governmental agencies in every possible way to meet these problems. With food rationing becoming more and more strict it has become necessary to devote more attention to methods of meeting nutritional requirements and the special needs of infants and of adults on special diets such as those suitable for use in the treatment of diabetes and peptic ulcer. The Council is keeping constantly in touch with governmental agencies charged with the promulgation and enforcement of orders pertaining to foods.

In cooperation with the Council on Industrial Health a Cooperative Committee on Nutrition in Industry has been established for the purpose of keeping physicians informed of newer developments in this special field. This committee already has held one meeting and helped arrange a program on the subject, some papers from which recently have been published in *THE JOURNAL*.

The activities of the Council on Foods and Nutrition during the year have been unusually numerous but mention will be made only of those matters that are of more immediate interest in the field of nutrition. There has been a crystallization of opinion about the fortification of foods with vitamins and minerals, or both, and the policies adopted by governmental agencies have been largely in harmony with those which have been painstakingly developed by the Council during the last several years. It is hoped that the enrichment of flour and bread which has now been made compulsory, will contribute importantly to maintaining the health of the civilian population. The Council adopted policies approving of the restorative addition of vitamins and minerals to processed breakfast cereal foods and in this connection has sponsored some original investigations to guide the Council and the industries concerned. Consideration has been given to the question of fortification of canned strained or chopped foods intended for the feeding of infants, small children and invalids, and it was decided that such fortification was unnecessary and hence would not be approved.

The scarcity of some items has brought to the attention of the Council a number of problems pertaining to the substitution of food ingredients. Much vitamin D milk which previously was prepared from a concentrate obtained from cod liver oil now is made with the use of other sources of vitamin D. On considering the evidence, the Council approved of a number of specific types of vitamin D milk but continues its require-

ments that the source as well as the unitage of the vitamin D be declared on the bottle caps. Manufacturers of ice cream have inquired about changes in the formulas of their products, and the Council has maintained the view that the quality, especially the nutritional quality, should be maintained, and that it would be preferable to produce less of an item rather than to diminish its food value.

COUNCIL REPORTS

In a detailed report which recently has been published, the Council has called attention to the desirability of maintaining "nutritional standards" in the formulation of mixed juices, frequently referred to as vegetable juice cocktails. The Council does not approve of juices of inferior nutritive value, which often are obtained when a product, such as tomato juice, is diluted for flavoring purposes with some other material.

A report was prepared and published on the comparative nutritional values of butter and oleomargarine. The evidence indicates that no nutritional disturbances accrue if oleomargarine is substituted for butter in the ordinary mixed diet of adults provided the oleomargarine supplies at least 9,000 units of vitamin A to the pound.

The nutritional problems frequently presented by sugar and manufactured food products containing large proportions of sugar were carefully studied and reports made. While sugar is a valuable food, the tendency of people to eat considerable quantities of the substance has placed an added burden on the other foods in the diet because sugar makes no contribution to the dietary requirements except for the calories which it supplies. Restriction of the use of sugar under wartime conditions would appear to be conducive to improved health if the calories previously consumed in the form of this food are replaced to an appropriate extent by foods that make a definite contribution to the nutritive requirements of the body. Consideration was given to the question of adding saccharin to foods and the Council has concluded that this practice is undesirable except for the production of special purpose foods specifically intended for dietary use by persons who for medical reasons, must restrict their carbohydrate intake. The Council also concluded that there is insufficient evidence to warrant the inclusion of sorbitol, a carbohydrate substitute, in ordinary foods.

In cooperation with the Council on Pharmacy and Chemistry, a report was published on the proper use of vitamins in mixtures. The principles introduced in this report already have served a useful function in the commercial formulation of these products. In cooperation with the Council on Industrial Health a report was prepared which discusses the pros and cons of the administration of vitamins to industrial workers.

OTHER ACTIVITIES

In conjunction with the Food and Nutrition Board of the National Research Council an exhibit was prepared on nutritional deficiency diseases. A pamphlet entitled "Food Charts—Foods as Sources of the Dietary Essentials" was also prepared. These activities have aroused considerable interest on the part of both physicians and the general public.

Under the auspices of the Council there has been published in THE JOURNAL a series of articles on foods and nutrition by leading experts in the field. This series of articles is now almost completed and will be reprinted in book form as a Handbook of Nutrition.

Summary

The Council on Foods and Nutrition during 1942 has kept in constant touch with developments in connection with food problems that have arisen as a result of the war and has aided governmental agencies in every possible way to meet these problems.

There has been a crystallization of opinion during the past year concerning the fortification of foods with vitamins and minerals, and policies adopted by governmental agencies have been largely in harmony with those of the Council.

The Council has given consideration to a number of problems pertaining to the substitution of food ingredients and has maintained in some instances that it would

be preferable to produce less of an item than to diminish its nutritional quality through substitution.

A Cooperative Committee on Nutrition in Industry has been established in cooperation with the Council on Industrial Health.

Reports of the Council published during the year included a report calling attention to the desirability of maintaining nutritional standards in the formulation of mixed vegetable juices, another on the comparative nutritional values of butter and oleomargarine and, in cooperation with the Council on Pharmacy and Chemistry and the Council on Industrial Health respectively, reports on the proper use of vitamins in mixtures and the administration of vitamins to industrial workers.

A series of articles on foods and nutrition by leading experts in the field have been published in THE JOURNAL under the auspices of the Council and will be reprinted in book form as a Handbook of Nutrition.

Council on Physical Therapy

The Council on Physical Therapy believes that because of the advances made since the conclusion of World War I when physical therapy proved to be of great value for rehabilitating men disabled in combat physical therapeutic procedures will be employed even more widely and to greater advantage during and following the present conflict. Therefore the Council considers that its most useful function in the present war emergency is the presentation of useful reliable and factual information about physical therapeutic methods for the attention of civilian army and navy physicians confronted with the task of rehabilitating the disabled soldier and much of the Council's activities during 1942 have been directed toward that end.

Because of the restrictions the War Production Board has placed on raw materials manufacturers of physical therapy equipment have been forced to limit the development of new products. In some instances manufacturers sell their entire output to the government and in other instances manufacturers have converted all the resources of their plants to the fabrication of materials of war. For these reasons fewer articles have been submitted to the Council for its consideration. The respite thus afforded in the investigation of apparatus has permitted the Council to intensify its study of problems pertaining to the application of physical therapy in the practice of medicine particularly in military medicine. Government agencies solicit the advice of the Council on physical therapeutic procedures and apparatus and the problems thus presented have been carefully considered. Many other inquiries have come from members of the profession and from the public and these too have been answered with the most reliable information at hand.

MANUAL ON PHYSICAL THERAPY

In cooperation with the Subcommittee on Physical Therapy of the National Research Council, the Council prepared a Manual on Physical Therapy, a booklet which describes the application of physical therapeutic agents in the treatment of the injured soldier. The Council is now cooperating with the American Occupational Therapy Association and the subcommittee of the National Research Council in the preparation of a Manual on Occupational Therapy which gives valuable suggestions to the medical officers in the armed forces and to the general practitioner about the role of occupational therapy in the rehabilitation of war injured.

COUNCIL CONSULTANTS

The field of physical therapy embraces many specialized fields and the Council is fortunate in having groups of consultants who advise the Council on the problems arising in special fields.

Education—Since the Council believes that 90 per cent of the clinical value of physical therapy is dependent on intelligent application of exercise, massage and heat, proper instruction of the physical therapy technician is of paramount importance. The Consultants on Education have given valuable advice regarding standards of education and experience for physical therapy technicians. Fortified with this information the Council

el has cooperated with the Council on Medical Education and Hospitals in revising the standard curriculum for schools for physical therapy technicians. The American Physiotherapy Association and the American Registry of Physical Therapy Technicians of the American Congress of Physical Therapy have contributed valuable assistance.

The Council authorized publication of an article entitled "The Responsibility of Medical Schools to Teach Physical Therapy."

Artificial Limbs—Participating with a group of specialists from the Association of Limb Manufacturers of America and with qualified surgeons having special information regarding amputations, the Council recorded its studies in the Handbook on Amputations recently published. This handbook gives useful information for the general surgeon regarding the proper site of amputation, the psychology of the patient, physical therapy procedures to pursue following amputation and training in the most efficient utilization of artificial limbs.

Audiometers and Hearing Aids—Manufacturers of hearing aids are not restricted as severely in the procurement of raw materials as are the manufacturers of other physical therapy equipment. With the help of the Consultants on Audiometers and Hearing Aids, the Council has continued to examine hearing aids and to publish reports. In conjunction with the consultants, the Council has revised and published the Minimum Requirements for Acceptable Audiometers and is now considering the revision of the minimum requirements for acceptable hearing aids.

An important contribution of the consultants has been the publication of a Tentative Standard Procedure for Evaluating Percentage Loss of Hearing in Medicolegal Cases. This article is the result of four years of careful study, during which all available known methods for determining the loss of hearing were examined and carefully scrutinized. It is believed by the Council that this contribution will be of great importance to the practice of medicine.

A survey of the work of the consultants was reviewed in the article "Five Years of Progress in the Field of Audiometers and Hearing Aids," which was published in *THE JOURNAL*. The Council appreciates the cooperation and advice which it has received from such organizations as the American Academy of Ophthalmology and Otolaryngology, the American Otological Society, the American Laryngological, Rhinological and Otolological Society and the American Society for the Hard of Hearing.

Respirators—Problems concerning the employment of respirators for producing artificial respiration over long periods of time were considered by the Consultants on Respirators and valuable suggestions were offered. To aid localities with no adequate supply of respirators, the Council published a report, "Simple Workable Respirator," giving specifications and directions for a homemade respirator.

Ophthalmic Devices—At its annual meeting in December 1942 the Council voted to reorganize its Committee on Ophthalmic Devices and defined its scope more clearly. Devices to be considered by this group of consultants are charts for testing vision and muscle balance, charts and instruments for orthoptic training, apparatus for applying heat to the eyes, diagnostic instruments of an optical nature and special or tinted lenses for which specific therapeutic claims are made.

ARTIFICIAL RESPIRATION

The Council continued its investigations and surveys in the field of artificial respiration, and evidence on both manual and mechanical artificial respiration has been accumulated. The survey of this problem, which is to be carried on over a period of five years, has been in progress but three years, and a complete report cannot yet be made.

ULTRAVIOLET RADIATION FOR DISINFECTING PURPOSES

Careful study has been given to the use of ultraviolet radiation for disinfecting purposes, and a statement declaring the Council's stand on the acceptance of ultraviolet lamps for this purpose has been published. The Council will consider for acceptance ultraviolet lamps for such use in operating rooms and in clinics and cubicles in hospitals when such places are

under the direction of physicians. The Council does not accept lamps claimed to be useful for sterilizing solids and liquids. The acceptance applies only to the disinfecting of air under controlled conditions.

"APPARATUS ACCEPTED"

The booklet "Apparatus Accepted" has been brought up to date and is available for distribution in its revised form. It contains a list of apparatus investigated and accepted by the Council.

RESEARCH

Through the Council's Committee on Research grants were made available for research to determine experimentally the minimum number and forms of electric current best suited for stimulation of normal and paralyzed muscles and to continue the survey of different methods of artificial respiration.

Twenty one reports of the Council on Physical Therapy were printed in *THE JOURNAL* in 1942.

The members of the Council on Physical Therapy and the Council's consultants who receive no remuneration have given most generously of their time and effort in promoting the work of the Council.

Summary

During 1942 the Council on Physical Therapy concentrated its efforts on reviewing the field of physical therapy and on making available reliable information about physical therapy in the treatment and rehabilitation of men disabled in combat. Because of the War Production Board restrictions, less physical therapy apparatus was submitted for consideration.

With the assistance of other groups, the Council prepared the Manual of Physical Therapy and the Handbook on Amputations, which have proved to be of great help to medical officers in the armed forces as well as to civilian practitioners. The Handbook on Occupational Therapy, now in preparation, should be a valuable guide to all who are interested in rehabilitation.

Important contributions of the Council's groups of consultants during 1942 were assistance in revising the curriculum for schools for physical therapy technicians, preparation of the Handbook on Amputations, investigation of audiometers and hearing aids, and published specifications for a homemade respirator.

Application of ultraviolet radiation for disinfecting purposes was studied, and a statement of the Council's position on the problem was published.

The booklet "Apparatus Accepted" was revised during the year.

Grants were made available for research on problems vital to physical therapy.

Council on Industrial Health

DEVELOPMENT OF INDUSTRIAL HEALTH SERVICE

As experience accumulates the Council on Industrial Health believes that any considerable spread of industrial health service particularly into smaller industrial units, or substantial elevation of medical standards in industry will depend on four major activities, namely creation of public interest, clarification of objectives, industrial medical education and improved industrial health organization in medical societies.

Creation of Public Interest—The greatest single obstacle to industrial medical development is lack of information about the health and economic benefits of preventive industrial medicine on the part of employers and employees.

It was recommended at the Atlantic City session in 1942 that an agency for public information preferably attached to the Subcommittee on Industrial Health and Medicine of the Office of Defense Health and Welfare Services be created to recruit industrialists with the advantages of medical service in industry. This recommendation was approved by the House of Delegates but it has not been feasible to operate in this fashion and an alternative suggestion has been to the effect that public instruction should emanate from the Council on Industrial Health. It is the present intention that the staff of the Council shall prepare educational material for publication in *THE JOURNAL* and

in HYGEIA for redistribution through the AMERICAN MEDICAL ASSOCIATION NEWS into suitable channels of public information.

Contact has been maintained with employer associations. The National Association of Manufacturers continues to conduct conferences on industrial health for employers in selected areas, and the Council undertakes to supply names of physicians in these areas who may be willing to assist in this kind of educational service. The Chamber of Commerce of the United States has created a Health Advisory Council, and one of its major functions will be concerned with industrial health. The Council on Industrial Health has been consulted in the preliminary plans and is represented on the Advisory Council itself. It is expected that through this agency trade associations may be reached as well as state and local chambers of commerce.

The Council believes that there should be closer contact with labor organizations and that effort should be made to enlist their cooperation not only in establishing and maintaining preventive medical services within plants but also in the development of programs of health education covering nonoccupational disability.

Clarification of Objectives of Industrial Health Service—Since its inception, the Council on Industrial Health has tried to define as concisely as possible the purposes of industrial health service.

The essentials of an industrial health service are:

1. A competent physician who takes genuine interest in applying the principles of preventive medicine and hygiene to employed groups and who is willing to devote regular hours to such service in the working environment.

2. Industrial nurses with proper preparation, acting under the physician's immediate supervision or under standing orders developed by him or by the committee on industrial health of the county medical society.

3. Industrial hygiene service directed at improvement of working environment and control of all unhealthful exposures to be provided by physicians and others with guidance and assistance from the specialized personnel in state and local bureaus of industrial hygiene.

4. A health program which should include prompt and dependable first aid and emergency and subsequent medical and surgical care for all industrially induced disability. Health conservation of employees through physical supervision and health education, close correlation with family physicians and community health agencies for early and proper management of nonoccupational sickness and injury, and good records of all causes of absence from work as a guide to the establishment of preventive measures.

Industrial Medical Education—Better opportunities for training have always been major objectives in the program of the Council. If there is to be greater demand for health conservation of the working population, physicians must be prepared to meet it. Educational activity in industrial health at the present time includes undergraduate and postgraduate study, intensive short courses and longer courses.

Considerable improvement has occurred in the kind and amount of industrial health instruction received by undergraduate medical students. A syllabus has been distributed by the Council to all approved medical schools in the United States and Canada and has been favorably received. This syllabus will be revised and redistributed in accordance with advances made in the field.

Introductory and refresher courses for the profession at large have usually been of one day's duration and have been offered in fifteen states. Contact has been established with the Associated State Postgraduate Committees of the State Medical Societies to extend this kind of activity.

Some experimentation is taking place with respect to intensive short courses under medical school sponsorship alone and in company with county and state medical society committees on industrial health. Response so far has been encouraging.

Opportunities for extended training by means of longer courses have been limited to a few professional schools. Until much greater development occurs along these lines, the status of industrial health as a specialty classification will be greatly retarded.

Improved Industrial Health Organization in Medical Societies—The Council has continued to take advantage of the structure of the American Medical Association to promote better medical organization for industrial health. All constituent state medical associations with the exception of Delaware, New Mexico and Vermont now have cooperating committees on industrial health. Some of them are doing excellent work, while others are committees in name only. Future success will depend on the reorganization of inactive committees and more comprehensive programs where progress is being made. Regular contact is maintained with these committees through bulletins, correspondence and field activity.

Some of the state committees on industrial health have met with considerable success in establishing cooperating committees in the county medical societies, a movement which contains the elements of genuinely successful organization. Full instructions for the guidance of these county society committees have been prepared and published by the Council.

There has been good progress in the relationship of the Council to the sections of the Scientific Assembly of the American Medical Association. Cooperating committees have been formed in all of the sections concerned. Some have already performed extremely valuable services, particularly those representing the Sections on Obstetrics and Gynecology, Dermatology and Syphilology, and Ophthalmology, while others are still in developmental stages. These agencies can be of immense assistance in educational and organizational activities.

The joint committee on nutrition in industry, composed of representatives of the Council on Industrial Health and the Council on Foods and Nutrition, has reviewed recent developments and will soon issue specific reports and recommendations. A symposium on this subject was sponsored by the joint committee at the fifth Annual Congress on Industrial Health.

A joint committee with the Council on Pharmacy and Chemistry is called for in a recent resolution of the Council on Industrial Health with a view to preparing and publishing an industrial medical formulary.

It is proposed to create a liaison committee with the Council on Physical Therapy as a means of maintaining close contact with agencies in the field of rehabilitation and for other purposes of report and procedure.

REFINEMENT OF MEDICAL PERSONNEL IN ESSENTIAL WAR INDUSTRY

A special activity of the Council during the past year stems from requests of the War Participation Committee and the Procurement and Assignment Service to develop a plan for recruitment and placement of medical volunteers for service in essential war industry. The Council's plan included a canvass by county medical society committees on industrial health of available health resources in industrial areas and especially of physicians already serving or willing to serve in industry, of county and state facilities for specialized industrial hygiene consultation and of the existing industrial nurse supply. The plan also included adjustment to additional requirements by notifying industry that if a plant needs additional medical service application should be made to the county medical society committee on industrial health, which in turn will decide whether the need is valid and will attempt to meet the need locally, that if no local resources are available, the state chairman of procurement and assignment with the help of the state committee on industrial health will attempt to locate and assign the nearest competent volunteer, or that, if no resources exist in the state, arrangements may be made for intensive postgraduate training of volunteers having no previous training or experience or out of state volunteers may be secured by application to the Council on Industrial Health. The details of this procedure have been called to the attention of the state agencies concerned.

COMMITTEES OF THE COUNCIL

The Committee on Physical Examinations has prepared an outline of physical examinations in industry, which will shortly be ready for publication.

In addition to encouraging physicians to report occupational diseases, the Council expects, through its Committee on Occupational Disease Reporting, to give much more attention to

absenteeism studies as a basis for clinical investigation of morbidity and mortality in the working population

The Committee on Research is attempting to establish working relationships with similar committees of the sections of the Scientific Assembly for clinical investigation into medical and surgical aspects of industrial health service

Cash and medical benefits for industrial disability in the opinion of the Council's Committee on Workmen's Compensation comprise only one phase of workmen's compensation. Additional effort should be made to incorporate prevention and rehabilitation into a well rounded program. Steps have already been taken to interest compensation administrators and rehabilitation officials in a cooperative program with the Council as a means of returning disabled workers to a self sustaining basis as quickly as possible. It is the intention of the committee to prepare for publication reports on the best prevailing medical opinion concerning medical aspects of workmen's compensation administration

INSURANCE RELATIONSHIPS

The Council has met from time to time with the Joint Claims Committee of the Stock and Mutual Casualty Insurance Companies and it has been agreed that some conference machinery should be established between the two bodies for regular discussion of matters of mutual interest

INDUSTRIAL NURSING

At the present time an Outline of Procedure for Nurses in Industry is being prepared which will consist mainly of standing orders to be used as a guide by industrial nurses without regular medical supervision

INDUSTRIAL MEDICAL SERVICE PLANS

The Council is impressed with the rapid growth of industrial medical service plans and believes that information about them ought to be collected and made available to the profession as quickly as possible

Summary

Four major activities must be energetically pursued if industrial health service is to become widespread and if standards of medical service in industry are to improve. These are creation of public interest, clarification of industrial health objectives, improved industrial medical training and better local organization for preventive industrial medicine, surgery and hygiene

The ramifications of industrial health service are widespread and, if the clinical, economic and social problems involved are to be met competently, the interest of all elements and established agencies in medicine must be secured and effectively employed. Cooperation has been requested from state and county medical societies, specialty groups and the councils and bureaus of the American Medical Association

The Council on Industrial Health has undertaken to organize programs which will induce physicians to take more interest in adequate service for small plants and to develop a means for staffing essential war industry on a volunteer basis

Committees of the Council are engaged in studies of physical examination in industry, occupational disease reporting, workmen's compensation and essential research

Nutrition of the industrial worker is receiving much attention from government, from employers and from workers

Medical service plans are affecting the whole field of professional relations in industry, and the Council on Industrial Health believes that data ought to be available concerning these plans

Contact has been maintained with agencies of the federal government and with insurance, industrial and professional groups interested in industrial health. Cooperation from labor will be sought in the inauguration and maintenance of preventive medical service in industrial plants as well as of health education in general

Bureau of Health Education

The impact of war on the work of the Bureau of Health Education has begun to be apparent. Increasing travel difficulties indicate that 1942 will be the last year for the duration in which the Director of the Bureau can do extensive traveling

There was a slight shrinkage in the total volume of mail handled by the Bureau during 1942 which is accounted for by a reduction in official communications with physicians, medical societies and public health agencies and a decline in radio audience mail. Question and answer correspondence showed no significant fluctuation

The arrangement continues whereby the office work of the Committee on American Health Resorts is carried on in the Bureau of Health Education by the Director and a stenographer assigned to the committee. The Bureau has recently been assigned the responsibility of cooperating with the Association's new Committee on Student Health

BUREAU PUBLICATIONS

Thirty-eight items were prepared in the Bureau for publication in *THE JOURNAL* and seventeen for publication in *HYGIEA*. Twenty-nine articles prepared in the Bureau appeared in publications other than those of the American Medical Association

RADIO

The second series of radio broadcasts under the title *Doctors at Work*, begun in November 1940 was completed during the annual session of the American Medical Association at Atlantic City in June. This was the eighth consecutive year of coast to coast network dramatized broadcasts. It continued to its close with every indication of enthusiastic acceptance by physicians, nonmedical radio listeners, radio reviewers and the National Broadcasting Company

For 1942-1943 a new type of program was decided on with a title which would link it with the war situation and with the successful 'Doctors at Work' broadcasts. The new program was entitled 'Doctors at War'. It was found advisable to adopt a presentation similar to that of the *March of Time*. Owing to network conflicts with opera, postseason football games and government broadcasts related to the war it was not possible to start 'Doctors at War' until Dec 26 1942. The time for the program was the same as for the last series of 'Doctors at Work' namely Saturday afternoons at 5 p m Eastern War Time

Use of the radio library service maintained by the Bureau for local broadcasting showed a slight increase over 1941. Twelve county medical societies used material from this radio library for the first time in 1942. The library now contains 753 titles a reduction from 919 in 1941. Conditions due primarily to the war have interfered with local broadcasting. This is a time when broadcasts by the medical profession are of special importance, and the Bureau hopes to furnish transcribed programs for local use as a means of helping to take up the slack and to make up for curtailed travel in 1943

The Director delivered sixteen radio talks over local stations outside of Chicago while traveling, and the Assistant Director delivered one

At the Atlantic City session three local broadcasts were arranged, plus one broadcast each on the networks of the National Broadcasting Company, the Columbia Broadcasting System and the Blue Network. One of these local broadcasts was of round table type

MEETINGS AND CONFERENCES

The Director and the Assistant Director traveled 32,041 miles to address audiences or attend meetings in twenty-two states. Twenty-seven medical audiences, 147 lay audiences and 42 professional audiences other than medical were addressed, with a total attendance of 62,724. Fifty-eight conferences and meetings were attended

Increasing costs, difficulties and travel delays consequent on the war situation make necessary a revaluation of the Bureau's activities. It appears advisable to turn to radio to replace travel

HYGIEA LOAN CLIPPING COLLECTIONS

Withdrawal of physicians from local communities has affected the demand for clipping loan collections, which in 1942 were

sent to only 265 physicians in 36 states and Canada. This is an activity which probably will be maintained "for the duration" at a low level.

HEALTH PUBLICATIONS

As a result of a large cut in the Association's paper quota consequent on the war situation, a careful review was made of the pamphlet situation. There was a total distribution of 365,787 pamphlets including 148,625 *HYGEIA* reprints, in 1942. This is the second successive year in which the distribution of pamphlets has increased enormously, the distribution in 1940 being 272,211. Since many of these pamphlets are purchased for use in schools the circulation of this printed matter is greater than the number of copies distributed. No estimate can be made of the total number of readers.

The health posters developed from 1938 to 1940 continue to be in demand. Seven hundred sets were sent out in 1942 making a total of 5,078 sets or 40,624 individual posters distributed since 1938.

SYMPOSIUM ON HEALTH PROBLEMS IN EDUCATION

The Symposium on Health Problems in Education customarily arranged in conjunction with the annual session of the American Medical Association, was omitted in 1942 because a previous symposium held at Atlantic City had been disappointing as to attendance. A symposium was held in connection with the annual meeting of the American Association of School Administrators in San Francisco in February 1942 sponsored by the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association with the cooperation of the American Association for Health Physical Education and Recreation, the Department of Home Economics and the Department of Science Instruction of the National Education Association.

COOPERATIVE RELATIONSHIPS

Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association—The Joint Committee met at New Orleans in April in conjunction with the annual meeting of the American Association for Health Physical Education and Recreation. The meeting dealt mainly with questions of health education healthful curriculum planning and specific problems in education with particular reference to food fatigue and activity. On the suggestion of the Association for Health Physical Education and Recreation, a committee was appointed to attempt to draft a statement dealing with the importance of exercise in relation to health and setting forth its benefits limitations and dangers according to age, sex and physical condition. The Director of the Bureau was invited to participate with this committee and such participation was authorized by the Board of Trustees which also authorized the Director to call for consultation on Drs. Henry A. Christian, Brookline, Mass.; John S. Coulter, Chicago; Peter J. Steincrohn, Hartford, Conn.; and A. C. Ivy, Chicago. This statement was not completed as of the end of 1942.

Dr. W. W. Bauer, Director of the Bureau of Health Education, was reelected to membership on the Joint Committee for a five year term.

United States Children's Bureau Advisory Committee—No meeting of this committee was held during the year.

American Association of School Administrators—Although the Yearbook Commission which prepared the yearbook *Health in Schools* has finished its work, the benefits of association with this project continue to be observed. Membership on this commission gives the Director of the Bureau of Health Education improved recognition in his dealings with school administrators. Invitations to participate in educational conferences, meetings of state education associations and the national organizations of educators appear to be increasing as a result of this project. The yearbook itself, which was published early in 1942, has met with unqualified and enthusiastic acceptance.

National Committee for Boys and Girls Club Work—This work proceeds routinely with nothing of particular interest to report in 1942.

National Congress of Parents and Teachers—The most significant development in 1942 was the modification of the health and

Summer Round-Up program taking cognizance of the scarcity of doctors and nurses in home communities and endeavoring to minimize the demands on the time of these professional persons without losing the interest and impetus which has been built up by Parent-Teacher organizations through years of effort.

Other Organizations—The following organizations on which the Director of the Bureau represents the American Medical Association, were inactive during the year though not officially discontinued: Advisory Board, American Camping Association, Committee on Public Health, American Film Center, Advisory Committee, Community Nursing Service, National Organization for Public Health Nursing, Accident Prevention Conference, U. S. Department of Commerce.

The Committee on Professional Education of the American Public Health Association rendered a report in 1942 and was discharged. This report of the committee has now been adopted by the Governing Council of the American Public Health Association. It outlines educational and personal qualifications for health educators and states broad definitions of their functions under different circumstances.

The National Health Council Committee for the Study of Voluntary Health Agencies met at St. Louis during the meeting of the American Public Health Association and received progress reports. Thus far the study appears to deal mainly in generalities.

The National Conference for Cooperation in School Health Education met in December pursuant to the call of its executive committee which met in November. The Director of the Bureau attended the latter meeting but was prevented by illness from attending the conference. The conference confirmed the action of the executive committee which recommended that the conference must either procure funds to carry out its work or disband since there is no profit in continuing to meet merely for an exchange of views out of which nothing constructive could grow because of lack of funds and personnel for development. The conference voted to attempt to secure a grant of funds.

The Bureau has cooperated with twenty nine agencies of the federal government or has furnished information to them during the year.

The Assistant Director of the Bureau has been appointed a member of the First Aid Medical Advisory Committee of the Chicago Chapter, American Red Cross.

MISCELLANEOUS

The Bureau was not called on during 1942 for active cooperation with the American Medical Association Committee for the Protection of Medical Research except to distribute to senior students in seventy one medical schools pamphlets on animal experimentation accompanied by pamphlets on medical economics.

The Bureau continued its cooperation with the Women's Auxiliary to the American Medical Association in its various projects.

The Director of the Bureau with the assistance of several members of the headquarters personnel furnished to Dr. L. D. Bristol for the Fuel Rationing Division of the Office of Price Administration a review of the literature relating to health and comfort temperature zones in homes, institutions, hospitals, commercial and industrial establishments, offices and other indoor places.

The Assistant Director of the Bureau was placed in charge of equipping a first aid and recovery room for the benefit of employees in the Association's building. This first aid room will also serve to fulfill requirements of the Office of Civilian Defense in case of enemy action. The Assistant Director is in charge of first aid under the Office of Civilian Defense in the headquarters building.

The Bureau continued to promote periodic health examinations during 1942.

Summary

Increasing travel difficulties indicate that 1942 will be the last year for the duration of the war in which the Director or the Assistant Director of the Bureau of Health Education can do extensive traveling.

Another result of the war has been a slight reduction in the volume of mail handled by the Bureau.

Office work for the Association's Committee on American Health Resorts continues to be carried on in the Bureau and, in addition, the Director of the Bureau has recently been assigned the responsibility of cooperating with the new Committee on Student Health.

The American Medical Association's radio broadcasting program is conducted under the supervision of the Director of the Bureau. A new type of program entitled "Doctors at War" was started for 1942-1943 and has received much favorable comment. There was a slight increase in the use of the radio library service maintained by the Bureau, although war conditions have interfered with local broadcasting. The Bureau hopes to furnish transcribed programs for local use in 1943. The usual radio programs were successfully put on during the annual session of the Association at Atlantic City.

The distribution of Bureau pamphlets, including reprints from *Hygeia*, continues to increase, and the demand for the health poster sets sent out by the Bureau on request is well maintained.

Cooperative relationships were continued in 1942 between the Bureau of Health Education and other organizations, including the Joint Committee on Health Problems in Education of the National Education Association and the American Medical Association, the U. S. Children's Bureau Advisory Committee, the American Association of School Administrators, the National Committee for Boys and Girls Club Work, the National Congress of Parents and Teachers, the National Conference for School Health Education, the Woman's Auxiliary to the American Medical Association and a number of other groups as well as twenty-nine official agencies of the federal government.

The Director of the Bureau, with the assistance of others of the headquarters personnel, furnished a review of the literature relating to health and comfort temperature for the use of the Fuel Rationing Division of the Office of Price Administration.

Bureau of Legal Medicine and Legislation

The preparation of an adequate index to the third volume of *Medicolegal Cases* was completed during the year and this volume, containing abstracts of more than eight hundred court decisions of medicolegal interest that were published originally in *THE JOURNAL* during the calendar years 1936-1940, is now available. The preservation of these abstracts in book form as recommended in a resolution adopted by the House of Delegates in 1932, makes readily available an important grouping of court decisions of medicolegal significance, indexed primarily so as to reflect the medical issues involved.

LAWS REGULATING THE USE OF BARBITURATES

In the annual report of the Bureau for 1940 it was pointed out that twenty-seven states had at that time enacted laws to prevent promiscuous sales of the barbiturates, twenty-five of which limited sales to sales on prescription. The House of Delegates recommended that efforts be made to stimulate the remaining states to enact similar legislation.

During 1942 the legislatures of only eight states were in regular session. In seven of these states legislation of the type under consideration had already been enacted. The remaining state, Louisiana, took no action with respect to the matter. In 1943 the legislatures of forty-two states have met to date. Later on the legislatures of three other states will convene. The Bureau has undertaken to carry out the recommendation of the House of Delegates by communicating with the secretary of the state medical association of each state lacking adequate legislation to prevent the misuse of the barbiturates. In two of the states from which replies were received, Arizona and South Dakota, evidence was supplied indicating that the sale of the preparations was already on a prescription basis by reason of regulations that had been promulgated by the proper enforcement agency and that additional legislation was therefore unnecessary.

In many of the states the medical associations decided to postpone action with respect to this particular legislation until the present war emergency has passed because of the pendency of many acute problems intimately associated with the war effort. In four states however, Massachusetts, Michigan, Missouri and North Dakota, legislation is now pending to effectuate the recommendation of the House of Delegates. In Connecticut amendatory legislation has been introduced further circumscribing the use of the barbiturates by preventing the refilling of prescriptions except in accordance with the written direction of the prescribing physician and by limiting the dispensing of the barbiturates by a physician to emergency use only. This bill also clarifies existing law so as to make certain that the barbiturates may not be dispensed except on prescription. The Bureau will continue its efforts to stimulate legislative action in this field.

MEDICAL LICENSURE AND THE WAR

Many problems of medical licensure have arisen because of the war. One was precipitated by the acceleration of medical courses so that students may graduate after three calendar years of study. There were provisions in medical practice acts of a number of states that prevented the licensure of applicants whose course of medical instruction covered such a short period of time. The Bureau undertook a study of all the medical practice acts and prepared a memorandum covering the results of its study which indicated in short, that there were nine states Georgia, Illinois, Kansas, Maryland, Michigan, Nebraska, New Jersey, South Carolina and Virginia in which graduates after thirty-six months of study could not qualify for licensure. During this study the Bureau collaborated closely with the Federation of State Medical Boards of the United States.

The Bureau and the Federation brought the situation to the attention of the state medical associations and the state medical licensing agencies of the nine states involved, urging that amendatory legislation be promptly enacted so that the graduates after the accelerated courses would not be penalized by inability to obtain licensure. In New Jersey, South Carolina and Virginia necessary legislation has been enacted. In Georgia no legislation to deal with the matter has been proposed. In the opinion of the medical examining board of that state none is necessary despite the fact that the medical practice act requires at least forty-two months to have elapsed between the beginning of the student's first course of medical lectures and the date of his graduation. In the remaining states appropriate legislation has been introduced with the exception of Illinois, where the legislative committee of the state medical society is preparing a draft of legislation.

Another licensure problem has been precipitated by the development of critical areas in some of the states, areas that have been depleted of the services of physicians by demands of the Army and Navy and areas in which there has been a sudden influx of population. The shortage in such areas in many instances, it is said, cannot be met by the relocating of physicians from other sections of the state involved and it has been necessary to consider the interstate relocation of physicians. Such a process has given rise to the need of providing medical licensure speedily to such relocated physicians. Following a meeting of the Executive Council of the Federation of State Medical Boards of the United States and the Directing Board of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians of the War Manpower Commission held in Washington, it was suggested as an expedient that legislation be enacted by the several states under which temporary permits could be issued to such out of state physicians as were willing to be relocated.

That temporary licensure even as an expedient to serve a desirable end is fraught with danger to established standards must be recognized, and considerable opposition has developed to the suggested expedient because of that recognition. It is felt by many that if the customary reciprocity procedures could be geared or adapted to provide licensure promptly for the relocated physician who has been found qualified by the examining agency of another state then the needs of critical areas could be expeditiously met without undermining the licensure standards that have been constructed over a period of many years.

In states maintaining no reciprocal relations with other states another solution must be sought, for civilian areas distressed by reason of the absence of medical care must be supplied that care either by action in or by the states themselves or in some other manner.

In seven states, Delaware, Kansas, Maine, Maryland, Nevada, Pennsylvania and Vermont, legislation is pending, modeled generally after the draft prepared during the December Washington conference, providing for the issuance of temporary permits or licenses to supply critical areas with needed physicians. Having the same objective in view is a pending bill in Congress relating to the District of Columbia. In the state of Washington legislation has been offered by means of which temporary licenses may be issued valid only until the next ensuing meeting of the examining board. In California a pending bill will speed up the reciprocity procedure so that there will result no unnecessary delay in providing licensure for the relocated physician.

In New York legislation suggests a different approach to the problem of supplying medical care for critical areas. It provides that whenever the governor shall determine that inadequacies of medical facilities or personnel arising out of conditions created by the national emergency exist in any area he may on the recommendation of the commissioner of health designate that area as an emergency one. The state commissioner of health will then be empowered, in cooperation with the local board or boards of health and other state, local or federal health or welfare agencies, to designate, appoint or employ for service therein such necessary medical and health personnel as may be required to meet the existing inadequacies. A somewhat similar approach is suggested by a Colorado bill which would authorize the state board of health to declare emergency areas. In such a declared emergency area all full time state, county and municipal public health officers who are graduates of medical, dental or nursing schools approved by the state board of health and who possess licenses to practice in any state will be authorized during the emergency to engage in practice in Colorado regardless of whether or not they hold Colorado licenses. Such public health officers will be permitted to make charges for all services of a private nature the fees to be deposited in the general fund of the state or in the general fund of a political subdivision, depending on whether services were rendered by an officer of the state or of the subdivision.

Under existing law in New Jersey a qualified physician of another state may be permitted to take charge of the practice of a New Jersey licensee during the latter's absence from the state. A pending bill proposes that such permission may be granted for a period of not less than two weeks nor more than four months and that the board of medical examiners in its discretion may extend such permission for further periods of two weeks to four months but not to exceed in the aggregate one year.

Another licensure problem will arise if plans now being formulated to accelerate premedical education are carried through. Medical practice acts in a number of states require that an applicant for licensure must present evidence of having completed two years of college work before beginning his professional course. It would seem obvious that, if premedical education is shortened to less than two years, changes will become necessary in the state laws to avoid a licensure problem. While it is possible that in some of these states administrative discretion may be lodged with the examining and licensing agency, such discretion may not be exercised in all the states.

There was at one time too a suggestion that the internship period be reduced, for the duration of the war, from one year to nine months. In ten states medical practice acts require that an applicant must have completed an internship of at least twelve months. A similar requirement obtains in other states, not by reason of any statutory provision but because of rulings of state boards. In the latter group of states, additional legislation would not be necessary because the matter could be adjusted by a change in board rulings. In the former group, however, amendatory legislation would be required. In two states, Delaware and Pennsylvania, bills have been introduced to reduce, for the duration of the war, the required period of internship from twelve months to nine months. This legislation does not

stem from the suggestion that has been made to reduce generally the period of internship to speed up the process of the education of physicians but from situations that have developed in hospitals by reason of the acceleration of medical courses generally. The Delaware bill has become a law.

Twenty-three states have enacted laws imposing on physicians the duty to renew their licenses annually in order to keep them in effect and to pay an annual registration fee. One other state, Missouri, provides for a biennial registration. A number of the states have recognized that injustice may be done to physicians in service who by reason of absence on duty with the military forces will be unable strictly to comply with these laws. To obviate such an injustice legislation has been proposed to exempt from the registration requirements physicians in the armed forces. Such legislation is pending in California, Colorado, Idaho, Kansas, Minnesota, Missouri, Nebraska, Pennsylvania and Washington.

COURSES IN MEDICAL JURISPRUDENCE

A survey has been initiated to assemble in the files of the Bureau authentic and detailed information with respect to the courses in medical jurisprudence now being offered in the accredited medical schools in the United States. Inquiries have been directed to the deans of such schools and the responses have been most gratifying, replies having been received to date from fifty-seven of the seventy-six schools. In many instances complete outlines of courses have been furnished and in others complete texts of the material used in the courses.

The purposes of the survey which is continuing, have been threefold: (1) to ascertain the extent to which the subject is now being taught; (2) to obtain detailed information on which to predicate the development of a program of study better to fit the young physician to meet contacts with the law in its various relations; and (3) to facilitate the distribution of source material to libraries of medical schools that may advantageously be used in connection with courses in medical jurisprudence. It is appreciated that the time is not propitious to urge now that additional emphasis be given to the subject in medical schools; other needs are more vitally urgent and compelling. The material that has been assembled, however, together with other data that it is hoped may become available will be carefully studied and compiled. It constitutes basic information on which to predicate recommendations later on.

LEGAL MEDICINE IN PHILADELPHIA

The Bureau has noted with considerable interest an important development in Philadelphia in the field of legal medicine consisting of an initial series of lectures on legal medicine under the direction of the coroner, Dr. H. M. Goddard, and under the sponsorship of the Philadelphia County Medical Society, the six medical and two law schools of the city, the Bar Association, the District Attorney's office and the Philadelphia College of Pharmacy and Science. The lectures are given at the headquarters of the county medical society and are open without charge to all students of the city's medical, law and pharmacy schools and of the police college, and to all physicians and lawyers. The initial series of lectures was well attended and received. Plans are being made to present a second series in the fall and possibly to repeat the program annually. Integrating as they do the various interests of the community that should be concerned with the development of sound knowledge on the subject of legal medicine, these symposiums may well set a pattern worthy of emulation elsewhere.

CERTIFICATION OF CHECKS IN PAYMENT OF NARCOTIC TAX

The House of Delegates at its Atlantic City 1942 session adopted a resolution in protest of the requirement that checks in payment of the annual tax of one dollar imposed on physicians by the Harrison Narcotic Act be certified, urged that the Association take steps for the elimination of the requirement and suggested that copies of the resolution be sent to important national dentist, veterinary, pharmacist, manufacturing chemist and banker organizations. Copies of the resolution were sent to the American Veterinary Medical Association, the American Pharmaceutical Association, the American Pharmaceutical

Manufacturers' Association, the American Drug Manufacturers' Association, the American Chemical Society, the American Bankers' Association and the American Dental Association. Three of the associations named merely acknowledged receipt of the communication, no replies were received from the others.

Collectors of internal revenue may, by law, receive uncertified checks in payment of certain taxes, such as income war profits and excess profits taxes. Section 3656(b) Internal Revenue Code, sets forth the conditions under which uncertified checks may be accepted by the several collectors in the following language:

Collectors may receive uncertified checks in payment of income war profits and excess profits taxes and any other taxes payable *other than by stamp* during such time and under such rules and regulations as the Commissioner with the approval of the Secretary shall prescribe (Italics supplied)

The Harrison Narcotic Act tax is paid by stamp and therefore under the existing law collectors of internal revenue are not authorized to receive uncertified checks in payment thereof. In the hope, however, that there was some possibility of the exercise of administrative discretion in the matter the Bureau addressed a letter to the Commissioner of Internal Revenue calling attention to the resolution adopted by the House of Delegates and to the fact that the present requirement is a source of irritation to physicians. It was suggested that if there was a practical way by which the matter could be adjusted administratively the reaction would be most beneficial. It was suggested to the Commissioner too that if uncertified checks could be accepted in payment of the tax and the delivery of the tax stamps held up until the checks have cleared the source of irritation would be removed and the collectors of internal revenue would, at the same time, be afforded protection to the same extent as they are at the present time. The Office of the Commissioner of Internal Revenue, however, not unexpectedly advised the Bureau that in the absence of a change in the law it would be unable to authorize the collectors to accept uncertified checks in payment of the narcotic tax.

In order to accomplish the results suggested in the resolution adopted by the House, it will be necessary to secure the enactment by Congress of amendatory legislation and, since such legislation, to be consistent, must abrogate the certification requirement with respect to all taxes paid by stamps, the probability of the Congress acquiescing in the suggested change would seem to be remote.

THE NEW FEDERAL INCOME AND VICTORY TAX

The revenue act of 1942 was approved by the President on Oct 21, 1942. It greatly increased the tax burden of physicians along with other federal income tax payers. It effected no changes, however, in the deductions that a physician may claim for professional expenses. A detailed statement of the provisions of the new law was prepared by the Bureau and published in the Jan 30, 1943 issue of THE JOURNAL to aid physicians in the execution of their returns, particular emphasis being placed on the requirements of the law in relation to physicians in service.

In the annual report for the Bureau for last year, attention was directed to an injustice that had existed for a number of years in the manner in which uncollected accounts on the books of a physician at the time of his death have been treated for income tax purposes. Efforts were made by the Bureau to correct that unjust situation. The efforts met with success. Hereafter such unpaid accounts will not be considered as part of the income of the decedent for the year of death, as has heretofore been the case, but will be taxable when paid as a part of the income of the person who received the money. This change in the law will relieve the estates of deceased physicians of a tax burden that might easily impose a very severe hardship.

A new provision appears in the act under which a taxpayer may deduct amounts expended for medical, dental and hospital care to the extent that such expenses exceed 5 per cent of the net income of the taxpayer but not in excess of \$2,500 in the case of the head of a family or \$1,250 in the case of other individual taxpayers. Prior to this new federal provision the income tax laws of two states, Idaho and Minnesota, specifically

authorized the deduction of such expended amounts. The Idaho law authorized the deduction of amounts in excess of \$100. The Minnesota law contained no limiting phraseology as to the amount to be deducted. Since the federal authorization was enacted legislation has been proposed in New York, Oklahoma and Wisconsin to authorize the deduction of an unlimited amount and in Iowa to authorize the deduction of amounts similar to those authorized in the federal act.

The new revenue act imposes a 5 per cent victory tax on individuals applicable to income received after Dec 31, 1942. Physicians generally need not be concerned with the payment of this tax until they file their returns on or before March 15, 1944 unless in the meantime a pay as you go system of the collection of federal income taxes is made effective. Beginning Jan 1 1943 however, physicians who were employers have been required to withhold the tax from wages paid in excess of \$12 a week or \$624 a year. Physicians who have been employees have had the tax withheld from their salaries. To apprise the medical profession of the obligations imposed on it by this new victory tax the Bureau prepared a summary of its requirements, which was published in the Dec 5, 1942 issue of THE JOURNAL.

SCIENTIFIC TESTS FOR INTOXICATION

Laws are in force in Indiana, Maine and New York that give recognition to the reliability of chemical tests to determine intoxication by specifically providing for the admission in evidence of the results of such tests. The courts too, even in the absence of specific legislation, have admitted the results in evidence in cases in which the suspected drunken person has voluntarily submitted to the test, on the general ground that the testing procedure has passed beyond the twilight zone of the experimental into the realm of demonstrable scientific dependability. Several cases involving the admissibility of this type of evidence have arisen in Iowa, others in Arizona, Massachusetts and Texas.

In the absence of consent to the tests, a few courts have declined to admit the evidence on the ground that if admitted the constitutional rights of the defendant would be impaired. Whether or not in reaching this conclusion these courts have made correct decisions cannot be debated here yet it can be said that some writers have taken issue with the legal philosophy followed by such courts. In order that full advantage may be taken of chemical tests to determine intoxication in meeting the drunken driver problem it would seem obvious that ways must be found to make the tests compulsory. None of the laws that have been enacted contain a compulsory feature nor do any of the bills that are currently pending in the legislatures of Illinois, Iowa, Nebraska and Wisconsin.

In 1942 the Committee on Tests for Intoxication of the National Safety Council appointed a special committee to study and recommend appropriate legislation in the field of tests for intoxication. A member of the Bureau's staff served on this special committee which has spent many months in reviewing critically a number of possible approaches to the problem through legislation. Through the efforts of this special committee it is hoped that final drafts of legislation will be formulated that can be recommended for enactment in the several states.

PRIVILEGED STATUS OF PHYSICIAN-PATIENT RELATIONSHIP

The American Law Institute at its May 1942 meeting adopted a Model Code of Evidence for submission to the several states for enactment. The second tentative draft of this code omitted all reference to a privileged status to be accorded the physician-patient relationship. The reasons assigned for the rejection of the status were, in effect, that such a privilege was not in the public interest that it fostered fraud by suppressing valuable testimony and that there was no evidence that the privilege tended to improve the public health.

The Bureau filed a brief with the Institute objecting to the omission, and a staff member of the Bureau attended the meeting of the Institute at which the code was to be considered for final adoption and presented reasons why the code should contain a provision according a privileged status to the relationship. It was pointed out that a privileged status is desirable because it inspires confidence in the patient to make a full dis-

closure to his physician of his symptoms and conditions and that such a disclosure is necessary to enable the physician adequately to perform his functions. The Institute was asked to reconsider the rejection of the privilege, to study the problems involved and to attempt to evolve a solution that would eliminate whatever abuses existed without at the same time impeding and hampering the medical profession in making available to the public the benefits of the art and science of medicine to the fullest extent. After a full discussion of the subject the Institute voted to include in the code a section dealing with the physician-patient relationship under which physicians may not, in the absence of the patient's consent, be compelled or permitted to testify, in any state that adopts the code with respect to information obtained by him by virtue of the relationship, subject to certain limitations and exceptions.

Among other things the privilege may be asserted by or on behalf of the patient only in a civil action or in the prosecution for a misdemeanor. The communication involved must have been confidential and reasonably believed by the patient or the physician to be necessary or helpful to enable the physician to make a diagnosis of the patient's condition or to prescribe or render treatment. No privilege will exist if the services of the physician were sought or obtained to aid any one to commit or to plan to commit a crime or a tort or to escape detention or apprehension after the commission of a crime or a tort. There will be no privilege as to any relevant communication (a) on an issue of the patient's condition in an action to commit him or otherwise place him under the control of another because of an alleged mental incompetence or in an action in which the patient seeks to establish his competence or in an action to recover damages on account of conduct of the patient which constitutes a criminal offense other than a misdemeanor or (b) on an issue as to the validity of a document as a will of the patient, or (c) on an issue between parties claiming succession from a deceased patient. There will be no privilege in an action in which the condition of the patient is an element or factor of the claim or defense of the patient. The privilege does not apply with respect to information which the physician or the patient is required to report to a public official or information required to be recorded in a public office unless the statute requiring the report or record specifically provides that the information shall not be disclosed.

The privilege will be terminated if the patient, his guardian or personal representative has caused the physician, his agent or servant to testify in any action to any matter of which the physician, his agent or servant gained knowledge through the communication.

The code defines a "confidential communication between physician and patient" to mean—

such information transmitted between physician and patient including information obtained by an examination of the patient as is transmitted in confidence and by a means which so far as the patient is aware discloses the information to no third persons other than those reasonably necessary for the transmission of the information or the accomplishment of the purpose for which it is transmitted.

This Model Code of Evidence, having been adopted by the Institute, will no doubt be recommended for enactment in the several states. In those jurisdictions in which a privileged status is now accorded the physician-patient relationship state medical associations may well compare the existing law with that proposed by the code.

STATE LEGISLATION

The legislatures of only eight states met in regular session during 1942. In addition there were special sessions held in thirteen states, two of which also held two special sessions. Little legislation of medical interest was enacted. A brief reference to the more important measures, from the medical point of view, that were enacted follows.

Medical Practice Acts—Five measures proposing amendments to existing medical practice acts were adopted in three states. As previously pointed out, enactments in New Jersey and Virginia amended existing laws so that graduates after accelerated

medical courses may obtain licenses. A new New York law provides that nothing in the medical practice act shall prevent the practice of medicine by an intern while serving in a state hospital or in a hospital of a political subdivision of the state. Another New York law provides that in the counties comprising the city of New York the filing fee for a license to practice medicine is to be \$2 instead of the previous \$1. A new Virginia law increases the per diem fee to be received by members of the board of medical examiners except the secretary from \$8 to \$10 and increases the salary of the secretary of the board from \$1,000 to \$1,500.

Osteopathic Practice Acts—An amendment to the Arizona osteopathic act was adopted which defines osteopathy as "that system of treatment and healing of abnormalities of the human mind and body as taught and practiced in the standard colleges of osteopathy recognized by the American Osteopathic Association" and which provides that no osteopathic practitioner may practice major surgery unless he has first subsequent to his fulfillment of all other requirements of the act at least two years of surgical internship in a hospital or hospitals approved either by the American Osteopathic Association or by the American Medical Association and then only in osteopathically owned or controlled hospitals or institutions.

Chiropractic Practice Acts—An amendment to the New Jersey chiropractic act was enacted which defines chiropractic as "The diagnosis or any ailment of the human foot or the treatment thereof by any one or more of the following means: local medical, mechanical, minor surgical, manipulative and physiotherapeutic or the application of external medical or any other of the aforementioned means except minor surgical to the lower leg and ankle for the treatment of a foot ailment, not including however the treatment of tuberculosis, osteomyelitis, malignancies, syphilis, diabetes, tendon transplantations, bone resections, amputations, fracture dislocations, the treatment of varicose veins by surgery or injection, the administration of anesthetics other than local, the use of radium, the use of x-ray except for diagnosis or the treatment of congenital deformities by the use of a cutting instrument or electrosurgery. The term local medical heretofore mentioned shall be construed to mean the prescription or use of a therapeutic agent or remedy where the action or reaction is intended for a localized area or part."

Premarital Examination Laws—The Maine premarital examination law was amended to permit a certificate of freedom from a venereal disease to be issued by a physician who is a graduate of a class A medical school and who is licensed to practice in any state. The previous Maine law limited the physicians who could issue such a certificate to physicians licensed to practice in Maine.

Narcotic Drugs—Amendments to existing uniform narcotic drug acts were adopted in Kentucky and New York. The new Kentucky law amended the exemption section of the act by limiting its applicability to the administering, dispensing or selling at retail of any medicinal preparation that contains in one fluid ounce, or if a solid or semi-solid preparation in one avoirdupois ounce, not more than one grain of codeine or of any of its salts. The New York amendment exempts from the provisions of the narcotic drug act the administering, dispensing or selling at retail of Stokes expectorant or brown mixture in a quantity of not more than 4 ounces to one person at one time, or any medicinal preparations other than Stokes expectorant or brown mixture that contains in 1 fluidounce or if a solid or semisolid preparation, in 1 avoirdupois ounce, not more than 1 gram of codeine or of any of its salts.

Dangerous Drugs—The Virginia law prohibiting the sale of stated hypnotic or somniferous drugs except on the prescription of a licensed physician, dentist or veterinarian was amended to include sulfanilamide, sulfathiazole, sulfapyridine, sulfadiazine, sulfaguanidine and any sulfanilamide derivatives by whatsoever trade name or designation, any related compound preparation, mixture or salt thereof, any salt or derivative thereof, and any preparation or mixture containing any of them.

Nurses—An amendment was adopted to the nursing practice act of New York which provides that nothing therein shall be construed until one year following the cessation of hostilities as prohibiting the practice of nursing by other than registered or practical nurses.

Infectious Diseases—A new Michigan law requires physicians to report all cases of venereal diseases coming under their professional observation. The state health commissioner is authorized to make rules and regulations for the care, treatment, hospitalization and isolation of persons afflicted with venereal diseases, but such persons shall have the right to select the physician or mode of treatment of their own choice. A person, however, neglecting to submit to treatment may be forcibly detained and subjected to treatment.

Cash Sickness Insurance—A new Rhode Island law creates a cash sickness compensation fund from which eligible employees (quite generally employees subject to the unemployment compensation act of the state) will be paid weekly benefits not exceeding \$18 during such period up to twenty weeks as they are unable to perform any services for wages because of physical or mental disabilities. To create this fund employers of eligible workers are required to deduct 1 per cent from the first \$3,000 of each employee's wages. This law is the first of its type to be enacted in the United States.

FEDERAL LEGISLATION

Seventy-Seventh Congress—The second session of the Seventy-Seventh Congress adjourned Dec. 16, 1942. Few measures of medical interest were enacted during the session other than those associated with the general war effort. Federal funds to the extent of \$5,000,000 were made available for loans to students pursuing accelerated medical courses and certain other designated technical courses. Legislative action was completed on a Treasury Department initiated measure to regulate the growing of the opium poppy in the United States and to provide for the manufacture of opium from the plants. The growing of the opium poppy, particularly in certain Western States, had become widespread and while the opium poppy was grown principally to supply a demand for poppyseed, the price of which had advanced from around 6 cents a pound to 50 cents a pound because of an inability to obtain the seeds from the normal sources abroad, the new venture did bring in its wake a distinct problem to law enforcement officials to prevent the diversion into illicit channels of opium obtainable from the opium poppy. The war too had greatly diminished the sources of supply for opium and the new law provides through a system of licenses a method by which the growing of the opium poppy may be regulated and by which in case of need opium may be manufactured in this country from the opium poppy that is grown, under the supervision of the federal government.

The employment by the military establishment of and the giving of a military status to female dietetic and female physical therapy personnel were authorized by another bill enacted late in December. This law too permits the employment of other technical and professional female personnel in categories required for duty outside the continental United States.

The Soldiers' and Sailors' Civil Relief Act was variously amended to provide additional civil relief for persons in military service. Of particular interest to the medical profession is a provision in the amendatory act under which leases entered into by persons who thereafter go into military service may be canceled. An analysis of the amendatory act was prepared by the Bureau and published in *THE JOURNAL* for Oct. 17, 1942.

Additional funds were made available to the United States Public Health Service for a continuation of a program to provide reserves of blood plasma in hospitals, the reserves being established to meet any wartime contingency caused by enemy action which may necessitate blood transfusions to civilians.

During the second session of the recently adjourned Congress the Bureau prepared monthly a factual analysis of federal legislation which was sent, in the form of a Federal Legislative Bulletin, to all state medical associations and to certain others. The purpose of the Bulletin is informative to give basic information concerning the measures before Congress having a

medical interest. The Bulletin will be continued. As heretofore while Congress is in session, the Bureau prepared weekly analyses of federal legislation which have been published in *THE JOURNAL*.

Seventy-Eighth Congress—The new Congress convened on January 6 of this year and immediately a flood of legislative proposals appeared many of which were identical with measures that failed of enactment in the Seventy-Seventh Congress. References to some of the more important of these proposals, important from a health standpoint, follow.

Female Physicians in the Medical Corps of the Army and Navy—Companion bills S 720 introduced by Senator Johnson, Colorado and H R 1857, introduced by Representative Sparkman, Alabama provide for the appointment of female physicians and surgeons in the Medical Corps of the Army and Navy. During the present war and for six months thereafter this legislation proposes there shall be included in the Medical Departments of the Army and Navy such licensed female physicians and surgeons as the Secretary of War and the Secretary of the Navy may consider necessary. Female physicians so appointed will be commissioned in the Army of the United States or the Naval Reserves and will receive the same pay and allowances and be entitled to the same rights, privileges and benefits as members of the Officers' Reserve Corps of the Army and the Naval Reserve of the Navy, with the same grade and length of service. Appointees may be assigned only to duty in hospitals or other stations where female nurses are employed but this suggested limitation has met with the opposition of the War Department and it is possible that the limitation will be stricken from the measure. The Secretary of War has indicated he has no objection to the enactment of the bill and present indications point to early action with respect to this matter.

Under another bill to establish a Women's Army Auxiliary Corps for service in the Army of the United States, it would be possible to commission female physicians in the Army. That corps at the present has been described as a body of uniformed civilians which performs its duties with the Army but is not a part of it. The House Committee on Military Affairs, however, has agreed to amend this bill so as to exclude physicians and nurses from the WAAC and if female physicians are to be commissioned in the Army, other legislation must provide for it.

Medical Care for Wives and Infants of Enlisted Men—President Roosevelt on February 1 submitted to Congress a supplemental estimate of appropriation for the Children's Bureau in an amount of \$1,200,000 to be used during the fiscal year 1943 in making grants to states to provide medical nursing and hospital maternity and infant care for wives and infants of enlisted men in the armed forces of the United States of the fourth, fifth, sixth or seventh grades. The requested appropriation has been included in a deficiency appropriation bill.

This new appropriation will permit a continuation, for the fiscal year 1943 of the program that was initiated by the Children's Bureau at the request of state health officers and financed so far by allotments totaling \$390,177 from funds available under the maternal and child health section of the Social Security Act. Reports received by the Children's Bureau indicate that from August 1942 to February 1943 in the twenty-one states reporting a total of 2,840 obstetric cases have been authorized for medical and hospital care under the program and the Children's Bureau has estimated from the requests for funds received that the amount submitted as a supplemental estimate by the President will be needed to finance the program during the remainder of the present fiscal year.

Legislation has been introduced to authorize an additional appropriation for each fiscal year during the period of the present war and for six months thereafter, but not in excess of \$6,000,000 in any one year.

Attendance of Personnel of the Army as Students at Educational Institutions—Legislative action has been completed on a bill under which during the present war and for six months thereafter personnel of all components of the Army of the United States may be detailed as students at technical pro-

fessional and other educational institutions, or as students, observers or investigators at industrial plants hospitals and other places. A law that was enacted by the Seventy-Seventh Congress authorized the detail as students of personnel of all components of the Army of the United States at technical professional and other educational institutions but restricted the number of students so detailed not to exceed 2 per cent of the officers and 2 per cent of the enlisted men of the Army and implied that they should be distributed proportionately among the various branches of the Army.

The House Committee on Military Affairs pointed out in its report on the bill recently passed that modern warfare requires that our army be furnished a continuous flow of personnel trained along scientific and engineering lines, that to meet this requirement the War Department has established a specialized training program, and that the restrictions imposed by the law passed last year would hinder the development of the program.

Federal Medical Academies—Two proposals have been submitted to the Congress under which federal medical academies would be established for the instruction of physicians for the armed forces or for the United States Public Health Service. One of these proposals, H. R. 691, was introduced by Representative Dickstein of New York and is pending in the House Committee on Military Affairs. This bill provides for the creation in each corps area of the United States of a medical training school for the instruction of physicians for the armed forces and for the United States Public Health Service. Each training school, it is proposed, will have a minimum of 295 students to be selected by members of Congress. On satisfactory completion of the course, the bill provides, candidates will be commissioned in the Army or Navy or in the United States Public Health Service, or any other service which may require their services. They must continue in such service for at least ten years unless the Secretary of War or the Secretary of the Navy, or the Surgeon General of the United States Public Health Service, as the case may be, shall certify that there is no further need for their services.

The other bill was introduced by Senator Thomas of Oklahoma, S. 655, and is pending in the Senate Committee on Military Affairs. It proposes to establish a United States Medical Academy to be operated under the supervision of the President for the training and instruction of persons in the manner which will best fit them for the performance of service as commissioned officers in the medical branches of the military and naval forces of the United States. In determining the manner in which the Academy will be operated, the President will, the bill provides, follow the rules, regulations and practices in effect with respect to the United States Military Academy at West Point or the United States Naval Academy at Annapolis. Persons who will receive training and instruction in the academy will be appointed by the President but they will be selected in the same manner, in the same number and by the same persons as in the case of midshipmen at the United States Naval Academy.

Reorganization of the United States Public Health Service
Temporary Promotions—Companion bills are pending to effect a reorganization of the United States Public Health Service, S. 400, introduced by Senator Thomas, Utah, and H. R. 649, introduced by Representative Bulwinkle, North Carolina, and referred respectively to the Senate Committee on Education and Labor and to the House Committee on Interstate and Foreign Commerce. These bills, introduced at the request of the Federal Security Agency, propose that the United States Public Health Service shall consist of the Office of the Surgeon General, the National Institute of Health and two bureaus to be known as the Bureau of Medical Services and the Bureau of State Services. The Surgeon General of the United States Public Health Service, under the supervision and direction of the Federal Security Administrator will be authorized to assign to the Office of the Surgeon General, to the National Institute of Health and to the two bureaus, respectively, the several functions of the Public Health Service and to establish such divisions, sections and other units as may be necessary.

The director of the National Institute of Health and the chiefs of each of the bureaus established will be commissioned medical officers detailed by the Surgeon General from the regular corps and while so detailed will be assistant surgeon generals and will have the same grade and receive the same pay and allowances as the assistant to the Surgeon General. Medical officers below the grade of medical director may be detailed by the Surgeon General from the regular corps to serve as chiefs of divisions, and not more than six of such officers at one time while so detailed shall have the temporary grade and receive temporarily the pay and allowances of a medical director.

The record of each commissioned officer of the regular corps initially appointed above the grade of assistant surgeon after the first three years of service in such grade, will be reviewed under regulations approved by the President, and any such officer who is found to be unqualified for further service will be separated from the service and paid six months pay and allowances. Original appointments in the commissioned corps of the Public Health Service may be to a junior grade which will correspond to that of a second lieutenant in the Medical Department of the Army and persons so appointed will be entitled to the same pay and allowances as second lieutenants in the Medical Department of the Army. After not less than two years of service each such appointee may be examined under regulations prescribed by the President and on such examination will be either promoted to the grade of assistant surgeon or be separated from the service. In the absence or disability of the Surgeon General and the assistant to the Surgeon General, or in the event of a vacancy in the office or both, the assistant surgeon generals will act as Surgeon General in the order of their designation for such purpose by the Surgeon General.

Provision has been made for temporary promotions in the United States Public Health Service by an amendment that was adopted to the deficiency appropriation bill H. R. 1975. The amendment provides that during the existing war and for six months thereafter any commissioned officer of the regular corps of the Public Health Service may be appointed to higher temporary grade with the pay and allowances thereof without vacating his permanent appointment, and that reserve officers of the Public Health Service may be distributed in the several grades without regard to the proportion which at any time obtains or has obtained among the commissioned officers of such service. Similar authority exists for temporary promotions in the Navy, Army, Coast Guard and Coast and Geodetic Survey.

Pharmacy and Chiropractic Corps in Army—Pending legislation would strike from the National Defense Act all reference to the Medical Administrative Corps and in place thereof make provision for a Pharmacy Corps in the Medical Department of the Regular Army, to be composed of seventy-two officers. Companion bills have been introduced to accomplish this result, S. 216, introduced by Senator Reynolds, North Carolina, and H. R. 997, introduced by Representative Durham, North Carolina, and pending respectively in the Senate and House Committees on Military Affairs. Appointments in the Pharmacy Corps, it is proposed, will be made in the grade of second lieutenant from pharmacists between the ages of 21 and 32 years who are graduates of recognized schools or colleges of pharmacy requiring four years of instruction for graduation under such regulations and after such examinations as the Secretary of War shall prescribe. An officer of the Pharmacy Corps will be promoted to the grade of first lieutenant after three years of service, to the grade of captain after six years of service, to the grade of major after twelve years of service, to the grade of lieutenant colonel after twenty years of service, and to the grade of colonel after twenty-six years of service.

There is considerable evidence that the sponsors of this proposal are energetically promoting its enactment. There have been inserted in the *Congressional Record*, for instance, from time to time copies of or references to memorials from state legislatures urging that the Congress promptly pass the legislation. Such memorials have been forwarded to Congress by

the legislatures of the states of California, Indiana, Iowa, Montana, New Hampshire, North Carolina, Oklahoma, Washington and, no doubt others.

The creation of a Chiropractic Corps in the Medical Corps of the United States Army is the objective of two pending bills, S 654, introduced by Senator Reynolds, North Carolina and H R 1990 introduced by Representative Hoch, Pennsylvania. This legislation contemplates that the Surgeon General of the Army shall appoint qualified officers in the proposed Chiropractic Corps in like number to that established by law for the Dental Corps and that such officers shall have the rank pay, promotion and allowances as well as the retirement provisions of officers of corresponding grades in the Dental Corps. Appointments in the Chiropractic Corps will be made in the grade of first lieutenant and all appointees will be required to take similar physical examinations as provided for the appointment of officers in the Medical Corps, and a professional examination which will include tests of skill in practical chiropractic and proficiency in the usual subjects taught in a standard chiropractic college. An officer of the Chiropractic Corps will be promoted to the grade of captain after three years of service to the grade of major after twelve years of service, to the grade of lieutenant colonel after twenty years of service, and to the grade of colonel after twenty-six years of service. This legislation too would permit the establishment of a Chiropractic Reserve Corps within the Medical Corps in accordance with the provisions of the National Defense Act with rank, promotion pay and allowances equivalent to that of the Dental Corps.

Interdiction in the District of Columbia—There are pending, respectively, in the Senate and House Committees on the District of Columbia, companion bills to prohibit experiments on living dogs in the District S 434, introduced by Senator Langer, and H R 33, introduced by Representative Burdick, both of North Dakota. These bills are identical in phraseology and provide that it shall be a misdemeanor for any person to experiment or operate in any manner whatsoever on any living dog, for any purpose other than the healing or curing of the dog, in the District of Columbia. Any person convicted of a violation of the proscription will be subject to a fine of not less than \$100 nor more than \$500, or imprisonment for a term of not less than three months nor more than one year, or both.

Chiropractors and the United States Employees Compensation Act—On the day after the new Congress convened, Representative Tolan, California, reintroduced his bill, H R 786 which if enacted would give chiropractors the right to treat the beneficiaries of the United States Employees Compensation Act. A companion bill, S 345, was introduced by Senator Murdock, Utah, for himself and Senator Gillette, Iowa. These bills are pending, respectively, in the House Committee on the Judiciary and in the Senate Committee on Education and Labor. At the time this report is being prepared, no action has been taken on either bill.

Cancer Control Trench Fever Experiments Influenza Epidemic—Representative Rogers, Massachusetts, proposes by H R 661, pending in the House Committee on Interstate and Foreign Commerce, to authorize a federal appropriation for the first year of the operation of the bill in the amount of \$2,300,000, and for each fiscal year thereafter such sum as may be necessary, to enable the United States Public Health Service to assist states, counties, cities or other political subdivisions to extend and improve measures through public and private institutions and organizations for the diagnosis, treatment and control of cancer. The measure contemplates the establishment of hospitals, diagnostic clinics and other facilities for the diagnosis and treatment of persons suffering from cancer or suspected of suffering from the disease. The sums to be appropriated will be allotted to such states as have plans for the control of cancer that have been approved by the Surgeon General of the United States Public Health Service. To the extent that facilities may be available, not to exceed 100 persons suspected of having cancer or known to have that disease may be cared for in hospitals operated by the United States Public Health Service for purposes of diagnosis, treatment and clinical study.

A bill introduced by Representative Lane, Massachusetts, and pending in the House Committee on Military Affairs, H R 1391, proposes to authorize the President to issue an appropriate medal and ribbon to be awarded to designated members of the armed forces of the United States during the World War who acted as voluntary subjects for experiments during the trench fever investigations in France.

Another bill H R 655 introduced by Representative Ludlow, Indiana, and pending in the House Committee on Commerce, Weights and Measures, would authorize the Secretary of the Treasury to cause to be struck a medal of appropriate design with suitable emblems, devices and inscriptions to be determined by the Secretary of the Treasury, or a certificate suitable for framing, to commemorate the faithful nursing of the women who voluntarily offered their services and who served with the Army during the influenza epidemic of 1918.

Extension of the Social Security Program—The President has submitted to the Congress the Report of the National Resources Planning Board copies of which are not available as this report is being prepared. That the report contains much of important concern to the medical profession, however, is evident from the discussions of it that have appeared in the newspapers. Apparently the board recommends far reaching expansions in the Social Security program, expansions to include permanent and total disability insurance, action by the federal government in cooperation with the medical profession to enable every person to budget medical expenses over a reasonable period, federal aid in developing a system of regional and local hospitals and other measures to assure "adequate medical and health care for all regardless of place of residence or income status." Initial reaction on the part of Congress to the board's report as reflected in the newspapers, presages extended consideration of the recommendations. An analysis of the parts of the report of interest to medicine will be carefully prepared when the report becomes available.

In the meantime there are pending in Congress many proposals to extend and expand the Social Security Act. Patterned after the Ehot bill introduced in the Seventy-Seventh Congress and analyzed by the Bureau in THE JOURNAL, Sept 26, 1942 is a Senate bill, S 281 introduced by Senator Green, Rhode Island. This bill, pending in the Senate Committee on Finance would, among other things, provide insurance benefits for workers permanently and totally disabled and hospitalization benefits and would authorize the Social Security Board to 'make provisions for the furnishing of medical, surgical, institutional rehabilitation or other services to individuals entitled to disability benefits if such services will aid in enabling the individuals to return to gainful work. Individuals who are hospitalized would be entitled to a hospital benefit of not less than \$3 a day and not more than \$6. In lieu of the payment of the hospital benefit directly to the individual, the Social Security Board might make arrangements with accredited hospitals for the payment of the reasonable cost of hospital service. No committee action has been taken on this bill.

Other measures would extend the old age and survivors' insurance benefits to employees of religious, charitable, scientific, literary and certain other corporations or associations, would provide for aid to permanently and totally disabled individuals, would extend the old age benefits provisions to male or female registered, graduate, undergraduate or practical nurses in respect of their employment outside of religious, charitable and other nonprofit institutions, would provide grants to states for aid to the physically handicapped and would create a Joint Committee on Social Security to be composed of designated members of the Senate Committee on Finance and of the House Committee on Ways and Means to make studies with respect to the needs and advisability of modification or enlargement of the present social security program and to consider proposals submitted to Congress in connection therewith. No action has been taken on any of these proposals.

Construction of Hospital Facilities—The creation of a special committee of the House of Representatives is proposed by a pending resolution, H Res 147, submitted by Representative O'Connor, Montana, to (1) investigate the hospital problem throughout the United States including a survey of all hospital

beds available to all persons engaged in warfare, (2) investigate the use of existing civilian hospital facilities (3) study the hospital problem in the United States as a whole as affecting not only war industries but industries in general and (4) report in writing to the Congress the results of such investigations together with recommendations. This resolution is pending in the House Committee on Rules.

The construction of marine hospitals in California, Florida and Oregon is proposed by other legislation. Eight bills have been introduced providing either for the enlargement of existing veterans' hospitals or the construction of new hospitals in Connecticut, Florida, Michigan, Pennsylvania, Rhode Island and Washington. A general veterans' hospital construction measure has been introduced by Representative Rogers of Massachusetts which would authorize such sums as may be necessary to enable the Administrator of Veterans' Affairs to provide additional hospital and outpatient dispensary facilities for persons entitled to hospitalization and medical treatment under the laws administered by the Veterans' Administration to care for the rapidly increasing load of disabled war veterans and to enable the Veterans' Administration to care for its beneficiaries in Veterans' Administration facilities rather than in contract temporary facilities and other institutions. This bill H. R. 667 is pending in the House Committee on World War Veterans Legislation.

Another measure which has the approval of the Senate Committee on Naval Affairs, would appropriate the sum of \$2,000,000 to expand the facilities for hospitalization of dependents of Naval and Marine Corps personnel and for certain other persons. As explained by the Senate committee the dependents of Army, Navy and Marine Corps personnel are now entitled by law to hospital and dispensary care. Hospitalization of dependents is restricted to acute medical and surgical conditions exclusive of nervous, mental or contagious diseases or those requiring domiciliary care. Existing facilities have been adequate for this service to dependents in peacetime but an expansion of such facilities is necessary to provide the service during a period of war. This bill too will authorize the hospitalization in naval hospitals of certain classes of civilians outside the continental United States. A companion bill, H. R. 1936 has passed the House.

Vocational Rehabilitation—Civilian War Benefits.—On Oct. 9, 1942 President Roosevelt in a special message to the Seventy-Seventh Congress, advocated an expanded rehabilitation program in relation both to veterans and to civilians who are physically handicapped. A number of bills were introduced in that Congress but no action taken on them. In the present Congress many bills of this character are pending. One, extending the benefits of vocational rehabilitation to veterans of the present war, has passed the Senate and House (S. 786). Another measure submitted by Senator LaFollette of Wisconsin S. 838 relates to the rehabilitation of persons disabled in war industries or otherwise the rehabilitation to be furnished under the supervision of a Rehabilitation Service to be established in the Federal Security Agency. Under this bill the Federal Security Administrator will be authorized to make rehabilitation services available to certain civilians who are disabled as a result of activities connected with the war effort by certifying such civilians to a state where such services will be provided under a state plan at federal expense. The bill too amends existing law under which federal aid is now furnished to the states for vocational rehabilitation programs. It would increase federal aid to the states.

To the extent and for such period as adequate rehabilitation services are not made available by a state, the bill would authorize the Federal Security Administrator to provide such needed services through contractual arrangements with public and private agencies and individuals. Except in the case of individuals certifiable as war disabled civilians, no physical restoration or repair, medical care, prosthetic or other devices or training allowances may be provided by a state plan to an individual unless it has been determined that he needs financial assistance with respect thereto. In those instances in which the bill would authorize the Administrator of the Federal Security

Agency to supply rehabilitation services, that official will be required to provide the physical restoration and repair, physical and occupational therapy, and hospitalization and medical care solely through contractual arrangements made by him with public and private agencies and private individuals. He would have no authority to construct, lease or otherwise acquire or operate any hospital, clinic or other medical facility. No person employed by the administrator under the authority contained in the bill will be authorized to engage in rendering medical or hospital care or treatment to any individual.

A number of bills have been introduced to provide benefits for civilians who sustain war injuries and for civilian defense workers who are injured while in the performance of duty or who contract a disease proximately caused by the performance of stated duties. One of these S. 450 introduced by Senator Pepper, Florida, proposes benefits for the injury, disability, death or enemy detention of civilians in the form of monetary payments and the supplying of medical services. The administrator of the Federal Security Agency would be authorized to supply doctors and nurses, services, drugs and other medicines, prosthetic and other appliances, hospitalization and other reasonable services for treatment and care to the extent that he may prescribe in regulations. The actual cost of such benefits may be paid directly or by way of reimbursement to any person entitled to such benefits or may be paid to the person furnishing such benefits. The bill provides that the administrator may use any private facilities or such government facilities as may be available for the treatment and care of any person entitled to benefits provided in the bill. No action has been taken on this bill or any other of the pending bills having a similar objective.

Mobilization of Scientific Resources.—Predicated on the premise that the full development and application of the nation's scientific and technical resources are necessary for the effective prosecution of the war and for peacetime progress and prosperity a number of bills are pending in the Congress under which an Office of Scientific and Technical Mobilization would be established to mobilize the scientific and technical resources of the nation. While these proposals apparently relate primarily to industrial research and problems, they are trained in broad language and may, if enacted, influence the future of scientific research conducted in educational institutions that relate primarily to medicine.

The federal agency to be created by one of the bills S. 702 sponsored by Senator Kilgore of West Virginia would be authorized in regard to scientific and technical facilities and personnel to mobilize, assemble, coordinate, develop and encourage and protect research, provide guidance and standardize. Physicians and dentists are excluded from the term "scientific and technical personnel" but corporations, whether operating for profit or not, associations, schools, colleges and universities are expressly brought within the field of operation of the bill.

To finance this program an initial appropriation of \$200,000,000 is suggested and thereafter such sums as may be necessary. Legislation similar to that pending was submitted to the Seventy-Seventh Congress and extensive hearings held but no action taken. The Kilgore bill has broad implications and merits continued and careful study.

Miscellaneous.—This report would be unduly extended if other than the briefest reference was made to other proposals of interest to medicine that have been submitted to Congress. It must suffice to say, in conclusion that a large number of bills suggest additional benefits to veterans of World War I and similar benefits to veterans of World War II. Others contemplate service pensions for contract surgeons of the Spanish-American War, water pollution control, prevention or alteration of fingerprints, medical and hospital care for certain civilians, education and employment of physically handicapped persons, identification insignia for rejectees with physical defects and income tax exemption of persons in military service. To paraphrase an old adage Many are introduced but few are passed.

Summary

Medicolegal Abstracts—An adequate index to Medicolegal Cases, Volume Three, has been completed and the book is now available

Barbiturates—Efforts are continuing to stimulate the enactment of legislation limiting the sales of the barbiturates to sales on prescriptions

Medical Licensure and the War—Many licensure problems have arisen in connection with the acceleration of medical courses, the relocation of physicians, the proposed acceleration of premedical education and the suggestion for shortening the internship period. Annual registration requirements may impose hardships on physicians in service. These problems have received the attention of the Bureau

Courses in Medical Jurisprudence—A survey has been initiated to assemble data concerning courses in medical jurisprudence offered in accredited medical schools. This study will be continued

Legal Medicine in Philadelphia—An important development in Philadelphia in the field of legal medicine occurred during the year that may well set a pattern worthy of emulation elsewhere

The Narcotic Tax—The requirement that checks in payment of the tax imposed on physicians by the Harrison Narcotic Act be certified results from a law enacted by Congress and can be modified only by amendatory legislation

The New Income and Victory Tax Law—The Revenue Act of 1942 imposes an additional tax burden on physicians but effects no change in the deductions that may be claimed for professional expenses. The injustice heretofore existing in the treatment of uncollected accounts on the books of a taxpayer at the time of death has been eliminated. A new provision authorizes taxpayers to deduct medical expenses. The new victory tax provisions impose additional obligations on physicians

Scientific Tests for Intoxication—Scientific tests for intoxication have received recognition by the legislatures and by the courts. A special committee of the National Safety Council has been created to formulate a model law, and a member of the Bureau's staff is serving on that special committee

The Physician-Patient Relationship—The Model Code of Evidence adopted by the American Law Institute recognizes the privileged status of the physician-patient relationship

State Legislation—Little legislation of medical interest was enacted by state legislatures in 1942. Medical practice acts were amended in New Jersey, New York and Virginia. In Arizona the osteopathic act was amended to permit the practice of surgery by osteopaths in hospitals osteopathically owned or controlled. A new definition of chiroprody was enacted in New Jersey. The premarital examination law of Maine was amended to authorize out of state physicians to execute certificates of freedom from disease. Narcotic drug acts in Kentucky and New York were amended further to restrict the sale of attenuated preparations. The sulfonamide compounds were put on a prescription basis in Virginia. The nursing practice act of New York was modified for the duration of the war. Venereal diseases were made reportable in Michigan and a cash sickness insurance program was adopted in Rhode Island

Federal Legislation—During the second session of the Seventy-Seventh Congress laws were enacted authorizing federal loans to students in medical and certain other schools, regulating the growing of the opium poppy and the manufacture of opium, providing for the employment of female dietetic and female physical therapy personnel in the Army, authorizing the cancellation of leases executed by persons who thereafter enter the armed forces, and continuing the program to provide blood plasma reserves. The publication of the Federal Legislative Bulletin was continued

Pending in the Seventy-Eighth Congress are bills for the commissioning of female physicians in the Army and Navy. Appropriations have been made available to supply medical care to wives and infants of enlisted men. The attendance of an unlimited number of personnel of the Army as students at educational institutions has been authorized. The construction of federal medical academies is the objective of pending bills. The creation of Pharmacy and Chiropody corps in the Army has been proposed

The reorganization of the United States Public Health Service is contemplated by bills introduced at the request of the Federal Security Agency. Animal experimentation in the District of Columbia will be unlawful if proposed legislation is enacted. The Tolan bill to authorize chiropractors to treat the beneficiaries of the United States Employees' Compensation Act has been reintroduced. Additional funds for cancer control and the recognition of services rendered in the trench fever experiments and in the influenza epidemic are proposed by bills awaiting action

A broad expansion of the Social Security program is suggested in the Report of the National Resources Planning Board. Pending legislation would authorize benefits, including medical care, for the permanently and totally disabled, would make available hospitalization benefits, would bring within the provisions of the Social Security Act employees now excluded therefrom and would in other ways broaden the benefits available at present

Other legislation would increase hospital facilities in marine hospitals for veterans, for dependents of Naval and Marine personnel and for certain civilians

A broadly expanded program for vocational rehabilitation of disabled persons has been advocated by the President, and legislation to effect that end is before Congress for consideration. Legislative action has been completed to provide for vocational rehabilitation of veterans of World War II. Pending legislation would provide benefits, including medical care, for civilians who sustain war injuries and for civilian defense workers

The mobilization of the scientific resources of the nation is the objective of pending legislation which merits careful and continued study. Other Congressional bills would provide additional benefits for veterans, service pensions for contract surgeons of the Spanish-American War, water pollution control, medical and hospital care for certain civilians, prevention of alteration of fingerprints, education and employment of physically handicapped persons, identification insignia for rejectees, and income tax exemption of persons in military service

Bureau of Medical Economics

Early in 1940 the Office of the Surgeon General of the Army, anticipating the demands that would be made for medical personnel should a national emergency develop, prepared a tentative procurement plan and presented it to the House of Delegates of the American Medical Association at its annual session held in New York in June of that year. The plan, which was endorsed in principle by the House of Delegates, contained the following items:

- 1 The American Medical Association to be asked to conduct a survey of the medical profession through its state and local activities

- 2 Each local or county society to canvass its members to determine, of those who expressed a willingness to serve, who should be available for the military service and who, on account of their age, physical disability or commitment in civil capacities, should remain at home

- 3 The county society to give to each one who expressed his willingness to serve, even though he might be selected to remain at home, a button similar to that which was designed for the Volunteer Medical Service Corps during the last war

- 4 The county society to list those who were selected for the military service according to their professional qualifications listing as surgeons, psychiatrists, and so on, only those who

were members in the national specialists' organizations. Also to select from those who were to remain at home qualified men for examination boards.

5 The state societies to maintain an available roster of members.

6 The American Medical Association to maintain a numerical roster of availability by states.

7 The Medical Department of the Army to have one or more selected officers on duty at the headquarters of the American Medical Association in Chicago.

8 The War Department, corps areas or regional officers to call on the American Medical Association for physicians or specialists as and when required.

9 The American Medical Association to call on the states according to their quotas, for the physicians required.

10 Each state, in turn, to call on its local societies for its quota of physicians.

At the same session of the House of Delegates a resolution calling for the creation of a Committee on Medical Preparedness was introduced by Dr. Arthur W. Booth, chairman of the Board of Trustees and was adopted by the House of Delegates. Authorization of this Committee on Medical Preparedness and the endorsement of the Surgeon General's plan for procurement demonstrated again the willingness of the American Medical Association to place its records and resources at the disposal of the federal government for whatever service might be helpful to the Surgeon Generals of the Army, Navy and Public Health Service in a national emergency.

CENSUS OF PHYSICIANS

Ever since 1909 the American Medical Association has published at short intervals information which has been essentially a census of the medical profession but the census growing out of the creation of the Committee on Medical Preparedness was the most complete and far reaching of any heretofore attempted. The Bureau of Medical Economics was designated as the agency to conduct the census and from its headquarters sent out, during the summer of 1940, special questionnaires to the entire medical profession of the United States. These questionnaires when returned to the Bureau of Medical Economics, were the source of the detailed and highly valuable data suggested. The process of collecting this census information extended through the second half of 1940 and through much of the year 1941. At the close of 1941, either a completed schedule had been received or an incomplete schedule had been prepared and filed for every known physician in the United States, both continental and territorial, including the Philippines. The original list of physicians, which was completed sometime before the close of 1941, has since undergone frequent and extensive revisions to meet the wartime requirements of the Army, the Navy and the civilian population.

In addition to the greatly enlarged staff working on this material, first in sending it out and then in editing and processing it as it was returned to the Bureau, members of the state medical associations and county medical societies and chairmen of the state committees on medical preparedness gave most valuable and indispensable assistance throughout the conduct of the census. In view of the countless hours this work took from their medical practice, these men deserve the sincere appreciation of the entire medical profession.

During the years 1940 and 1941 it was necessary, to meet the rapidly changing conditions to make extensive changes in the personnel of the clerical staff of the Bureau of Medical Economics. As it became evident that an increasingly larger percentage of the work of the temporary staff of the Bureau of Medical Economics would need to be devoted to military affairs, a more equitable arrangement of administrative and financial details was effected through conference with Col. Charles G. Hutter, M. C., who had been detailed to the American Medical Association as liaison officer by the surgeon of the Sixth Corps Area.

PROCUREMENT AND ASSIGNMENT SERVICE

The Procurement and Assignment Service for Physicians, Dentists and Veterinarians, which was established with the approval of the President of the United States as a part of the Office of Defense Health and Welfare Services, was organized

in October 1941. In order that the information that had been assembled in the Bureau of Medical Economics by the Committee on Medical Preparedness might be fully utilized by the Procurement and Assignment Service, the Bureau was named the Consultant Office of the Service, and the director of the Bureau was designated as supervisor of that office. This arrangement continued from October 1941 until near the close of 1942 when it was deemed advisable to effect a physical separation of the office of the Procurement and Assignment Service and the Bureau of Medical Economics. Accordingly, after the Bureau of Medical Economics had carried on its own work for two and one-half years with a minimum of personnel, a branch office of the Procurement and Assignment Service was established at the American Medical Association headquarters with Lieut. Col. Harold C. Luthi, M. C., who had succeeded Col. Charles G. Hutter as liaison officer of the Sixth Corps Area in charge.

The census of physicians conducted by the Committee on Medical Preparedness is a reservoir of most interesting and valuable data relating to the prewar medical profession of the United States but for the duration this reservoir will have to be left very largely unstudied except as it pertains to the present needs of the armed forces and the civilian population. However, as the work progressed from the period of census taking in 1940 and 1941 to the establishment of the Procurement and Assignment Service certain facts became evident. All the original estimates of the number of physicians required for all purposes in the war effort had to be increased, some highly important specialist groups were greatly overtaxed, maintenance of arbitrary quotas was both difficult and unwise and the civilian population would be compelled to accustom itself to a smaller quantity and a different type of medical care.

Although the census was conducted for the first year against the background of the European war, had the war not come to this country the census would still have been of the great value suggested earlier in this report since it gave the American medical profession detailed information about every physician in this country. The size of the task, however, greatly limited the other work of the Bureau of Medical Economics during the latter half of 1940 and all of 1941.

Beginning with Pearl Harbor the American Medical Association along with other groups in the country, turned its energies to the war effort. In spite, however, of the tremendous task of analyzing and digesting the mass of data contained in the census and in spite of the added pressure of work caused by the creation in the Bureau of the Consultant Office for the Procurement and Assignment Service the Bureau of Medical Economics was able to continue that phase of its peacetime work which had to do with the analysis of prepayment plans for medical care.

PREPAID MEDICAL SERVICE

From time to time in the past several years the Bureau of Medical Economics has prepared for the medical profession descriptive material and critical analyses of different types of medical organizations designed to meet a variety of needs and conditions. These descriptive and analytic accounts have been published for the information and use of any interested individuals or groups. Among the subjects covered are "Contract Practice," "New Forms of Medical Practice," "Medical Service Plans," "Group Medical Practice," "Medical Care for Migratory Workers" and "Organized Payments for Medical Services." These descriptive and analytic reports apply to a considerable number and variety of actual operating arrangements.

Medical societies in different parts of the United States have repeatedly helped to develop methods to solve some particular problem. The part played by medical societies in the organization and operation of medical service plans should be mentioned in this category. The unit method of payment used by the medical service bureaus of the state of Washington appears to have been one of the earliest arrangements of the kind in the United States.

It is important to note that in Washington and Oregon medical service bureaus using a unit system arrangement for prepayment were developed by medical societies in an effort to overcome evils that had grown up under contract practice of an earlier date.

This unit method of payment has been fully described in "Organized Payments for Medical Services." It is important to note here that much of the success of the Washington plan, as it was called at that time, rested on

1 A voluntary association of physicians known as the "county medical service bureau"

2 A nonprofit corporation the county medical service corporation which contracted with employers to provide medical and surgical care and other services for its employees

3 An agreement between the corporation and the physicians of the county medical service bureau for the provision of medical and surgical services

By the summer of 1941 some twenty state medical societies had taken steps toward the introduction of a medical service plan to operate over the entire state. In Washington and Oregon, while there is some statewide supervision the initiative remains with the county medical societies that have organized medical service bureaus

The following organizations were developed with the active support of the respective state medical societies after intensive studies had been conducted and with earnest desire to develop truly helpful plans

California	California Physicians Service San Francisco
New York	Medical and Surgical Care Inc Utica
	Medical Expense Fund of New York Brooklyn
	Western New York Medical Plan Inc Buffalo
New Jersey	Medical Surgical Plan of New Jersey Newark
Michigan	Michigan Medical Service Detroit
Pennsylvania	Medical Service Association of Pennsylvania, Harrisburg
Colorado	Colorado Medical Service Denver
North Carolina	Medical Service Association of North Carolina Durham
Massachusetts	Massachusetts Medical Service Boston

In 1935, when the Bureau of Medical Economics presented its report to the House of Delegates on the number and nature of social experiments then being conducted by the medical profession, some two hundred or more different methods had been proposed for the organization of such services. The experiments were so diverse that even an enumeration was considered difficult.

Although many of the details of organization and administration must differ widely, there are some fundamentals that ought to characterize all medical service plans. A part of the Special Report of the Bureau, approved by the House of Delegates in 1935, seems no less applicable today than at that time

UNDESIRABLE TENDENCIES IN SOME PLANS

"In designing the operating plans to provide medical care for the low income groups, county medical societies may well consider the dangerous, destructive and unethical tendencies which even the most carefully conceived and constructed plans may assume. Some of these may follow an incomplete or inaccurate preliminary estimate of the medical situation, some may result from the unpredictable factor of human nature, others may follow as the natural outcome of changes in the general economic conditions entirely beyond the control of the medical profession. Regardless of the causative factors, which may vary in different communities, county medical societies must be prepared to recognize and deal with complications affecting the organization of medical care under the specifications of a county plan just as their members are trained to deal with complications which often occur to change the course of the diseases which they treat. Some of these dangers and complications are

DANGERS TO BE AVOIDED

"1 The adoption and operation of a medical plan where it is unnecessary

"2 The stimulus aroused by good plans among irresponsible organizers to develop and operate imitations and counterfeits

"3 The establishment in medical practice of dangerous patterns following the adoption of undesirable types of plans

"4 The compromise of medical societies in the corporate practice of medicine or in the operation of insurance companies as a result of an insufficient study of state statutes and case law

"5 Failure, in the operation of a plan, to conform to the Principles of Medical Ethics

"6 The almost inevitable transition of voluntary insurance plans into compulsory contributory sickness insurance systems operated by the state

"7 The difficulties involved in the failure adequately to provide for complete control of medical affairs by the medical profession

"8 The freezing of medical fees at a point below that which is consistent with good medical care

"9 Failure to bear constantly in mind that a medical society plan is an experiment in the methods of distributing medical service and that it may have only a temporary usefulness, may need frequent or drastic modifications or may need to be discarded entirely

"10 Medical society plans must not be considered or accepted as a substitute for the regular practice of medicine as applied to the majority of people. If it is believed such plans may be useful they should be considered merely as supplementary facilities in the distribution of medical service. They should be used only so long and in such a manner as they serve efficiently to make more easily available to low income groups a high quality of medical care

VITAL FACTORS TO BE RECOGNIZED AND PROTECTED

"Regardless of the sincerity of those who devise and operate a good medical plan, such a plan may only stimulate counterfeits promoted by irresponsible people. Competition between medical plans inevitably reduces the quality of the service and disturbs the public confidence

The Medical Profession, in its professional associations, is the only possible body that can organize the supply and distribution of that service without harmful effects on, and possible destruction of, that service itself. This principle has already been accepted in all countries by the establishment of systems of licensure, medical education and other standards of medical service set up by the profession to protect the public. It is recognized in the decisions of courts restricting the furnishing of such service to those who have met professional standards and in the rulings that expert evidence concerning medical matters can be given only by those who have met such standards

"This situation is not changed in any essential way by the fact that the progress of medical science and art has caused the creation of many subsidiary organizations and much mechanical and scientific equipment. All these things center around and are dependent on the medical profession. The 'point of production' of medical service is where the individual physician meets the individual patient. Hospitals are built and conducted to create the best possible environment for that contact. Laboratories are maintained to improve the conditions of that contact. Nurses, social workers and others concerned have a similar function

"It therefore follows that in any plan to improve the adjustment of the relations between these two economics the medical profession must retain a central position in all that concerns the valuation and delivery of medical service. There is another practical reason why this must be true. While each of the other elements involved plays an important part, the common element without which no one nor all of them can function in the delivery of service is the physician. Just as he is the central and the essential element at the point of production of medical service, so he must exercise a position of leadership and control in any reorganization of the methods of giving that service. The profession needs, and will always welcome, the cooperation and advice of all elements affected in health problems, but just as the individual physician must constantly assume the tremendous responsibility of decisions that involve life and death with individual patients, so the profession as a whole must assume the leadership and responsibility in the organization of medical service in the community"

Two types of reports can be prepared to show the nature and growth of medical service plans. Each has its value, but the one which deals with specific phases of organization and administration should be more helpful to administrators in widely separated areas having very different problems. It is proposed in supplemental reports, therefore, to keep these discussions as informal as possible and to reduce to a minimum the statistical tables and analyses which do not have a direct

relation to the descriptive part of the reports. It is hoped, on the other hand, to be able to include, with the assistance of experienced field staffs, explanations of the reasons for the differences in administrative procedures.

EXPERIENCE WITH MEDICAL SERVICE PLANS

The comparatively short experience of medical society service plans has already taught many valuable lessons. These lessons are offered here in tentative form for study and as aids to further experimentation.

Comparatively little can be learned from plans controlled by other than medical agencies or from many elaborate studies of the costs of medical service. Some medical society plans have been required to give subscribers three or four times as much medical service as the Committee on the Costs of Medical Care estimated would be needed. Actuarial calculations based on the experience of lay-managed groups, cooperative or industrial plans or foreign experience with compulsory sickness insurance are often misleading. Some of these organizations may balance their books, to some extent at least, by restricting the amount or lowering the quality of the medical care given usually without the full knowledge of the subscribers.

A medical society plan cannot so deceive its subscribers. The first sentence of the Ten Principles, adopted in 1934 by the House of Delegates of the American Medical Association, reads: "All features of medical service in any method of medical practice should be under the control of the medical profession. Professional control involves responsibility for the quality of the medical service. This responsibility must not be evaded in any plan organized and operated by a medical society."

There are many "unknown quantities" in the equation that must be solved to insure even the financial stability of a medical society prepayment plan. Existing morbidity statistics and theoretical estimates of medical service needed, drawn from private practice or lay-managed prepayment plans, are not a sound basis for such calculations. Most of the unknown quantities are human characteristics, calling for a knowledge of social psychology as well as of mathematics. We can now at least list and examine some of these.

1 The offering of a prepayment medical service the quality of which is guaranteed by the medical profession increases the demand for medical care much more than any one anticipated. Compulsory sickness insurance and lay administered medical service plans do not create a demand for medical service even among their subscribers, which is as adequate to the need as does private practice. This has been shown in morbidity and mortality statistics and in the failure to discover incipient disease among those served by such schemes. Economic inhibitions perhaps cause some persons to demand less medical service from private practice than they sometimes need. Malingering and excessive demands for unnecessary medical care under various forms of sickness insurance have often been described. Professionally administered plans, as will be pointed out later, suffer from a somewhat different aspect of this same weakness.

The demand for services under prepayment plans may show a different pattern from what has been established in private practice. The report of the Michigan Medical Service surgical plan for 1941 reveals that the largest "number of patients per thousand enrolled" demanded service through the months of April to August inclusive, a condition contrary to the generally accepted seasonal variation in illness. Hospital insurance plans have an excess of hospitalization during vacation periods. Such phenomena are illustrations of the well known but often overlooked fact that need and demand for medical services are not the same. Calculations of the cost of medical care that omit this fact are misleading.

2 The reaction of the public as shown in sales resistance has an important effect on the success of the plan. Premiums must be within the limits of the valuation placed by the average person on the preservation of his health. Few persons have made the sort of calculations of the money value of medical service which all consumers are erroneously supposed to make for all the goods they desire to purchase. Such calculations are harder to make for medical services than for tangible goods. Sickness and injuries are seldom foreseen, and their seriousness and dura-

tion cannot be foretold. Specific, definite medical benefits cannot readily be promised or price tagged.

3 Actuaries, physicians or consumers cannot determine accurately the effect of various contract provisions on the minds of possible purchasers of prepayment medical care. What will be the exact effect of the exclusion of preexisting conditions, for example, on the cost of the plan or the health of the subscriber? Will such provisions make selling the plan easier or more difficult? It will take experience and analysis to determine the financial medical and psychological effects of such a comparatively simple factor as a 'deductible clause' requiring payment for the first visit or of a cash limit on the amount of service given during a year.

4 Some subscribers to a prepayment plan will always be trying to "get something back" for their money. If this tendency becomes contagious it may throw the most careful actuarial calculations out of line. This human characteristic may be met in many ways, some of which are a brusque refusal of requested care, setting up rules and restrictions, or perhaps worst of all giving superficial diagnosis and treatment to all in the effort to spread the medical resources. Some or all of these methods are almost standard practice under compulsory sickness insurance. None is suited to a professionally administered plan. Experience with some of the Farm Security Administration plans possibly offers a suggestion. Here financial resources make it necessary to limit the amount spent for medical services. This fact has sometimes been explained by the administrators and ways pointed out by which the available medical care can be made most helpful to all the subscribers. A similar campaign of public education is now being conducted by state and county medical societies to make the best possible use of the reduced civilian medical resources during the war. It may be well to borrow the lesson of these experiments, but always remaining entirely frank with the subscriber.

There is danger in this method also. It may cause subscribers to neglect seeking medical care when needed. It may lead administrators of medical care plans to follow the example of compulsory sickness insurance and lay-administered plans and assume that it is the function of managers of medical plans to guard medical service from subscribers. The objective should be to guard against abuse and encourage use—a narrow path hard to follow, but the only one that makes the available medical service most valuable to those who need it.

5 Some physicians assured of payment through a medical plan may perform unneeded surgical procedures that may be of little benefit to the patient. The solution of this problem is a professional responsibility. A medical society that dodges it has failed in one of its fundamental functions in relation to medical service plans. Some medical society plans have met this problem through "medical directors," "medical advisory committees" or similar agencies that have the courage to meet the situation and are backed by fearless and efficient medical organizations. Failure to curb this tendency promptly not only may destroy the financial stability of a medical service plan but may greatly weaken public respect for the profession.

6 The type of clientele served, while less significant in determining conditions of success of service plans, does have an important if sometimes indirect influence. Will that clientele be dominantly industrial, commercial, rural, in occupational groups or widely dispersed? Since group enrolments seem essential to avoid adverse selection, the character of the group, especially with regard to sex, age and environment, must be considered. The wide diversity which exists in these respects in the United States shows how impossible it is to construct a "model plan" or to lay down many generalities applicable to all plans even in such a limited group of states as, for example, Massachusetts, Mississippi, North Dakota and Texas.

Little consideration has been given as to how comprehensive prepayment medical plans should or may become. Existing plans have been largely confined to industrial groups in urban centers. They must be far wider in coverage if they are to occupy the field to such an extent as to obviate universal compulsory action by government. Restricted coverage is probably desirable and necessary in the early stages, but, as with almost every social institution the problem of where it is going must

never be lost from view. California Physicians' Service has already extended its scope into several new fields. It supplies medical care to migratory workers and groups of assisted farmers under the Farm Security Administration, to an experimental rural plan of the Interbureau Coordinating Committee on Post War Programs and the U. S. Department of Agriculture, to a housing project, to war industries, and has considered entering the field of university health care. The New Jersey medical plan is organized for similar extensions of scope but has not been in existence long enough to permit any conclusions.

Every expansion into a new field will include subscribers whose income, environment and customs cause them to place different values on medical care. New methods of approach and perhaps of organization and of administration and service may have to be developed.

7. Closely allied to the problem of expansion is that of income. In the beginning there seemed to be unanimous approval of the ninth of the 'Ten Principles' which reads: "Systems for the relief of low income classes should be limited strictly to those below the 'comfort level' standard of incomes." Opinions differed on the income indicating a 'comfort level' but the first plans usually placed it somewhere between \$2,000 and \$3,000 per family annually. The selling program soon met the fact well known to sociologists, that every group including the employees of an industry has a solidarity which resists efforts to break it up into income or other groups. The 'key men' in all the minor groups of an industry, who are also the 'key men' in any selling program had no interest in a plan which excluded them. Consequently some of the recently organized plans have set up no income limits. Whether such a cutting of the Gordian knot is a solution remains to be determined.

8. The question of income limits has a bearing on the comparative desirability of 'indemnity' or 'service' benefits. Experience has as yet given no decisive answer to this question but the tendency to change from a "complete" to a "surgical" service has led to a proposed combination of the two plans to meet the other problem of income limits. When, under the "surgical" plan, service is given to hospitalized patients, the distinction is based on whether ward or private room care is elected by the patient. The contract covers service in wards and the patient who takes a private room is assumed to be able to contribute something in payment for his care, just as he does for his private room under the terms of hospital insurance. Therefore, while the prepayment covers the full cost of service in a ward, it is paid only as an "indemnity" toward the cost of service in a private room, and the physician is entitled to make an additional charge.

COMPLETE SERVICE VS SURGICAL PLAN

Perhaps the difficulty of calculating the actuarial effect of the human elements involved is one reason why most of the original 'complete medical service' plans are changing to plans limited to surgical and obstetric care for hospitalized patients. It early became evident that an unlimited medical care plan involved a greater expense than can be met by any premiums the public is at present willing to pay. In the case of those for whom the plans were especially designed, this cost is perhaps more than they can pay without restricting other expenditures, some of which may be as necessary to health maintenance as medical service. There was also difficulty in controlling excessive demands, often for unneeded service and of too great willingness by a few physicians to grant such demands.

The "surgical and obstetric" plans simplify many of these problems. Restricting service to hospital patients selects "catastrophic" cases and eliminates most 'minor' diseases. It is not a perfect screen for this purpose. Surgical and obstetric procedures in hospitals are more specific than general treatment at home, and more easily fit into actuarial calculations. Much can be said for the argument that such a plan really meets the most urgent needs of the subscribers. Treatment of minor illnesses (the "bagatelle diseases" that plague all systems of compulsory sickness insurance) usually do not require an expense beyond the resources of a moderate income. Such restricted service corresponds to the customs and environment of the urban industrial worker who looks to hospital treatment for serious sickness. Limiting care to hospitalized patients also makes it

possible to reduce overhead cost by arrangements with existing hospitalization plans for solicitation and record keeping. This interlocking of administrative work has led to some conflicts and difficulties and has encouraged movements on the part of hospital groups to include medical service in hospitalization plans.

In spite of the adoption of surgical plans, it seems to be recognized that they do not fully meet the need of subscribers for medical care. Such plans do not cover all the "catastrophic" diseases. They limit medical care plans largely to urban districts, since hospitals are less available and less patronized in rural districts and rural towns. They do not provide for preventive measures like the early diagnosis of incipient disease and tend to discourage prompt use of medical service when it may be most useful. No one disputes these defects, and they afford no indictment of such plans. Complete medical service remains the ideal, but to urge its immediate installation may be a counsel of unattainable perfection.

The public has not yet been educated to recognize the value and the cost of a complete service, medical and surgical, and it has been deceived as to cost by the propaganda for compulsory sickness insurance and for lay-administered plans. Many such plans have led their clients to believe that comprehensive service is being given by existing schemes, or could be given by proposed plans for much less than its actual cost.

The first step, the omission of which has caused some stumbling, would seem to be more adequate education of the public to the real values of a complete medical service, with greater emphasis on its actual cost. That this ideal has not been overlooked even by medical societies that have started with a limited plan is seen from the following statement in the Report of the Special Committee to the Massachusetts Medical Society house of delegates: "Your committee urges a gradual approach to our ultimate ideal—total medical coverage by a comprehensive policy—through well defined initial steps of partial coverage."

SOME THINGS LEARNED

A prepayment plan for medical care is complex. It touches closely nearly all emotions, prejudices and customs in our society. It lacks the experience and evolution common to most social institutions. Compulsory sickness insurance systems in every country, and throughout their entire history, have been subject to continuous changes. In spite of their anchorage to legislation and government regulation none as yet show any signs of approaching equilibrium. It is therefore not surprising that plans of such duration as those of medical societies in the United States are still largely experimental.

A few questions seem to have found at least a temporary answer. A longer educational period is necessary before a complete medical service can be furnished with financial security. Several quantities in the equation "premiums = cost of service" are still unknown, but experiments are searching out and measuring most of these without endangering the financial structure. We know that there must be some flexibility in income limits. Selling is a bigger problem than anticipated, there is no such public demand for prepayment of medical services as advocates of private and government schemes have claimed. Professional supervision of all the standards of medical service must be made one of the dominant features of prepayment services as it has always been of private practice. The protection of the subscribers, the financial security of the plans and the honor of the profession demand this.

In nearly every country in which free discussion is permitted the organization of medical care is one of the most debated subjects. The effect of proposals of the medical profession on any development depends on their definiteness and the unity and promptness with which they are presented.

MEDICAL SERVICE PLANS OF THE FARM SECURITY ADMINISTRATION

The medical care plan is only a part of the general program of the Farm Security Administration which was started in 1935 with the announced purpose of "helping low income farmers to get a greater degree of independence and security." This general program is based on a system of federal loans accompanied by assistance in farm management and in the organization of local resources.

The first plans were started after only a minimum of consultation with organized medicine and varied widely in many of their features. A few were legal corporations, some were "farmer cooperatives" dealing with medical societies and occasionally with salaried physicians. Sometimes loans were issued to individual families to pay for specific services. Contracts were, in some localities, made with groups of physicians. This diversity involves no criticism. Given the existing state of knowledge or, better, ignorance of the factors involved in the problem of organizing any general plan of providing medical service, it was necessary to proceed by "trial and error" with a certainty that there will be no lack either of "trials" or of "errors" on the part of those conducting the experiment. These experiments did demonstrate that any successful plan of medical care must rest on constant consultation and close cooperation with the physicians who give that care and with the medical societies which alone represent the medical profession.

The Farm Security Administration has now adopted a policy of close cooperation with state and county medical societies and is pledged not to introduce any plan against the opposition of these groups.

The House of Delegates of the American Medical Association has laid down the principles which determine its policy. The first of these is the foundation of all the others. It reads: "All features of medical service in any method of medical practice should be under the control of the medical profession." No complaints that this principle is infringed in any Farm Security Administration plan have been reported. This would seem to be the most general and basic test of the acceptance by the medical profession of any of the present plans of payment for medical service. All other phases may be subject to bargaining and compromise, but any yielding of control of the standards of medical care to those who are unqualified to exercise that control is a betrayal of the trust which has been confided to the medical profession.

VITAL REPORTS AND RECORDS

Each decennial census of the United States provides an unusual wealth of data, the most complete and reliable statistical data of the decade. Ordinarily the census data are accompanied with a detailed explanation which greatly enhances the value of the tabulations. Much of the census bureau work is of such great importance in many fields that the loss or interruption of even a relatively small part of the basic tables and discussion may be irreparable. In view of their value and importance in many fields, it is hoped that it will not become necessary to discontinue the compilation and publication of these basic statistical tables because of lack of funds.

Since vital records and reports are dependable and helpful just to the extent that such records are complete, accurate and honestly made, any vital records system is valuable to this and succeeding generations only to the extent that integrity becomes a part of such records and reports and the subsequent use of them.

Summary

The census of physicians begun in 1940 by the Bureau of Medical Economics was given over entirely to army and civil service personnel at the close of the calendar year 1942.

Reasonably complete information is now available pertaining to ten medical service plans, most of which are organized to operate over statewide areas. The exceptions are in New York, in which state three organizations are operating although even more have made a start at different times.

The demand for prepaid medical care, with quality guaranteed by the medical profession, is increased when offered on a prepayment basis.

Public reaction shown as sales resistance has an important bearing on the success of various kinds of medical service.

Actuaries, physicians or consumers cannot determine accurately the full effect of various contract provisions on the minds of possible purchasers of prepaid medical care.

Some subscribers to prepayment plans will always try to get something back for the dues or rates charged.

Some physicians when assured of payment for services will engage in surgery that may be of little value to the patients treated.

Closely allied to the problem of expansion of the plans is that of the income level of the subscribers.

The question of income limits has a bearing on the relative desirability of "indemnity" or "service" benefits.

The public has not been educated to recognize the value and the cost of a complete service, medical and surgical.

Professional supervision of all the standards of medical service must be made one of the dominant features of prepayment services as it always has been of private practice.

The medical service plans which were started in about 1935 with the announced "purpose of assisting low income farm families to get a greater degree of independence and security" are being conducted in accordance with the principle that "all features of medical service in any method of medical practice should be under the control of the medical profession."

Unless a sufficient amount of money is made available to the census bureau, it is feared that some important basic census publications cannot be made available for even limited distribution.

Bureau of Investigation

During 1942 the Bureau of Investigation continued its part in the educational activities of the American Medical Association. The work of the Bureau consists primarily in receiving and dispensing information concerning "patent medicines," quacks, frauds, fakes and faddists to physicians, lawmen, government agencies, Better Business bureaus, business corporations, newspapers, radio stations and high school and college students who are making studies of such material.

Since the enactment of the Food Drug and Cosmetic Act of 1938 and the Wheeler-Lea Amendment to the Federal Trade Commission Act there has been a gradual decrease in the number of inquiries received by the Bureau particularly from physicians. This is most largely due to the fact that in accordance with the provisions of the new laws active ingredients are declared on labels. On the other hand inquiries from students and teachers have doubled presumably because of the increased amount of consumer study being conducted in both the high schools and the colleges of the nation. Education of this age group would seem to be a far greater service than the supplying of physicians with the names of ingredients of remedies. Inquiries from Better Business bureaus, newspapers and magazines and government agencies have been constant since the enactment of the legislation referred to. Items inquired about during 1942 totaled 8,400, the leading specific subjects of inquiry being in regard to a cathartic and cold remedy, an antacid, aspirin and a headache cure. These leading subjects represent less than 38 per cent of the total number of subjects about which inquiries were received.

The Bureau of Investigation contributed eight original articles to THE JOURNAL during 1942 and in addition seven presentations of abstracts of Cease and Desist Orders and ten of abstracts of Stipulations issued by the Federal Trade Commission, nine articles containing abstracts of Notices of Judgment issued by the Food and Drug Administration and twelve articles containing abstracts of Fraud Orders issued by the United States Post Office Department. The original articles referred to were prepared largely by the Director, who also prepared various other items for publication in THE JOURNAL, while the articles consisting of abstracts of various actions of federal agencies were prepared by the Assistant Director.

During the year 1,775 pamphlets issued by the Bureau were distributed, and lantern slides and a film strip of these slides were supplied to physicians and educators on request.

The Director of the Bureau made nine addresses to lay audiences and professional groups during the year. The Bureau has continued its efforts to be helpful to various agencies of

government and to civic organizations and has made information in the files of the Bureau available to officials concerned with various phases of the war effort. In addition, the Director of the Bureau has aided the Council on Pharmacy and Chemistry as editorial supervisor of *U.S. Drug*, *The Epitome of the U. S. Pharmacopoeia* and *National Formulary* and the *A. M. A. Internist's Manual*. He has continued in the capacity of secretary of the Association's Committee on Cosmetics and has completed one year of service as Assistant to the Secretary of the Association.

Summary

During the past year the Bureau of Investigation has continued its efforts to maintain the work which was instituted in 1906, supplying to the profession and the public information obtained from all possible sources with regard to subjects which fall under its purview. As the result of recent federal legislation, inquiries from physicians have lessened, but inquiries from students have gradually risen in a four year period from 12 per cent to 28 per cent. The importance of education of this age group is self evident.

The Director made nine talks and addresses to professional and lay audiences during the year and cooperated as fully as possible with representatives of various government agencies and civic organizations. Contribution of articles to *The Journal* by the Bureau was maintained at the same level as during the previous year.

Bureau of Exhibits

The Bureau of Exhibits during the year 1942 continued its activities in graduate medical education with the Scientific Exhibit at the Atlantic City session, with exhibits from the Association headquarters at state medical meetings and other scientific meetings and with medical motion pictures. Health education for lay groups was carried on with health exhibits from the Association headquarters and with motion pictures.

THE SCIENTIFIC EXHIBIT

The Scientific Exhibit at the Atlantic City session exceeded all expectations both in the number of exhibits available and in the caliber of the work presented. The difficulties of preparation and transportation of exhibits and the problem of participants suddenly called into active military service or kept at home by an excess of work interfered less than had been anticipated. A considerable number of exhibitors who already were in the service of the armed forces were able to attend the Atlantic City meeting and demonstrate their exhibits. The emphasis of the Scientific Exhibit, however, was not primarily on the war but more on the problems of the physician in general practice.

The 1942 annual session was noted for the participation of physicians from Latin American countries. There were eighteen exhibits listed from those countries, including five from Argentina, four from Brazil, one from Chile, two from Colombia, one from Peru, two from Mexico and three from Cuba. Because of transportation difficulties only thirteen exhibits were actually shown, and of these one received a gold medal and one a certificate of merit. Certificates of participation were presented to the remaining eleven exhibitors.

The problems of medicine in wartime were presented by members of the United States Army, the United States Navy, the United States Public Health Service, the Selective Service System, the Office of Civilian Defense and the Procurement and Assignment Service. Other government agencies were represented by members of the Bureau of Mines and the Children's Bureau.

Features of the meeting were two special exhibits sponsored by the Committee on Scientific Exhibit of the Board of Trustees. The special exhibit on fractures was shown for the thirteenth time over a period of seventeen years and attracted even larger audiences than in previous years. Dr. Kellogg Speed, Chicago, was chairman of the special exhibit committee. The special exhibit on backache was shown for the third time and proved more popular than ever. The exhibit was presented

with the cooperation of a large committee, of which Dr. Frank R. Ober, Boston, was chairman.

Each of the sixteen sections of the Scientific Assembly sponsored groups of exhibits dealing with the various specialties of medicine as they are encountered by the physician in general practice. Each section appointed a representative to the Scientific Exhibit to act in an advisory capacity and to assist with the program. These section representatives were of inestimable help and deserve much credit for the high quality of material obtained.

Motion pictures were shown continuously throughout the week in four motion picture theaters. No films were shown in exhibitors' booths, thus preventing the blocking of aisles. Each film was shown once each day on a regular schedule.

Awards were made to forty-three exhibits, including six medals, twelve certificates of merit, twelve honorable mentions, eleven certificates of appreciation and two special certificates of merit. The Committee on Awards, of which Dr. Harold S. Diehl, Minneapolis, was chairman, performed its task with perseverance and credit.

ASSOCIATION EXHIBITS

Association exhibits include exhibits which depict the activities of the various councils and bureaus of the Association and closely allied subjects in which those departments are interested. During the year nineteen new exhibits were produced and two old exhibits discontinued, making fifty-six exhibits now available for loan purposes. There are twenty-five medical exhibits for use at medical and other scientific meetings, twenty-one health exhibits for fairs and expositions, and ten exhibits which can be used for either group. Medical exhibits were sent to twenty-three meetings in twelve states. Many of the meetings used two or more exhibits, making the total medical exhibits lent during the year forty-four. A considerable number of reservations for exhibit material were canceled because of cancellation of meetings or unexpected curtailment of programs. Health exhibits were presented on thirty-five occasions in seventeen states, a total of forty-nine exhibits being used. Many of the state fairs and other large gatherings which ordinarily use much exhibit material were canceled in 1942, thus reducing the demand for exhibits.

Active cooperation with museums has been continued in accordance with the action of the House of Delegates at the New York session. Permanent exhibits have been maintained at the Cleveland Health Museum, the Chicago Museum of Science and Industry and the Toledo Museum of Science. At the Cleveland and Chicago museums the question and answer service, which was established in 1940, has been as popular as ever. Answers to questions are sent by mail through the cooperation of the Bureau of Health Education. The American Museum of Health in New York has postponed opening permanent quarters until after the war, but the exhibit material from the American Medical Association which was shown at the New York World's Fair has been lent to the Cleveland Health Museum for display. Other museums with which the Bureau has cooperated in health displays include the Public Museum at Grand Rapids, Mich., the Valentine Museum at Richmond, Va., and the Tower of Health at Madison, Wis.

MOTION PICTURES

Motion pictures fall into two groups, medical films for medical societies and other scientific groups and health films for lay groups. Numerous requests are received for information concerning such films, and much time is consumed in keeping files up to date. Several hundred new medical pictures, only a small proportion of which are available for general distribution, are made each year. Health films are sponsored by many national and state organizations. The total number of health films for public showing is much smaller than the list of medical films.

The Bureau of Exhibits has prepared no general list of motion pictures, but, as requests are received for information concerning pictures on specific subjects, lists are compiled according to the needs of the inquirer. The film library now consists of twenty-six titles, three of which were added during the last year. There are seven on physical therapy and six on anes-

thesia, miscellaneous subjects making up the remainder. Six of the pictures are suitable for public showings. It will be necessary to add materially to the list of films during the coming year to meet the demand from county medical societies. During the year two hundred and forty-five films were sent out to one hundred and fifty meetings in thirty states. Army camps are using motion pictures to an increasing extent for groups of medical officers.

PUBLICATIONS

Booklets and pamphlets prepared by various special exhibit committees under the sponsorship of the Bureau of Exhibits include the Primer on Fractures, Fundamentals of Anesthesia, Varicose Veins and Food Charts. Many thousands of copies have been distributed. The fifth edition of the Primer on Fractures is being prepared for publication in 1943.

Summary

The Scientific Exhibit at the Atlantic City session was notable for the participation of physicians from the Latin American countries and for the presentation of war problems by the Army, Navy and other governmental agencies. There was a total of two hundred and sixteen exhibits, including special exhibits on fractures and backache, and demonstrations on poliomyelitis and diabetes. Four motion picture theaters were in continuous operation, showing seventy-eight films each day.

Association exhibits for loan purposes were sent out ninety-one times to fifty-eight meetings in nineteen states. During the year nineteen new exhibits were added, making a total of fifty-six now available for loan. Museums continued to be the recipients of loan exhibits, active cooperation being maintained with such institutions in six states. Motion pictures in the film library number twenty-six. They were sent out two hundred and forty-five times to one hundred and fifty meetings in thirty states. Many hundreds of requests for information concerning motion pictures on particular subjects were answered. Books and pamphlets prepared originally for use in the Scientific Exhibit have been distributed through the Order Department, the most popular being the Primer on Fractures, Fundamentals of Anesthesia and Food Charts.

Committee on Student Health

In compliance with suggestions offered by government officials, the Board of Trustees has appointed a Committee on Student Health. The members of this committee are Dr. Joseph L. Raycroft, Princeton, N. J., chairman, Dr. Ruth E. Boynton, Minneapolis, Dr. Arlie V. Bock, Cambridge, Mass., Dr. Frank B. Kelly, Chicago, and Dr. O. N. Andersen, Stanford University, Calif.

This committee has had two meetings, one in Washington and one in Chicago, and is now engaged in formulating working plans.

Committee on Conservation of Vision

The following Committee on Conservation of Vision has been appointed by the Board of Trustees: Dr. Conrad Bercus, New York City; Dr. J. V. Cassidy, South Bend, Ind.; Dr. E. C. Ellett, Memphis, Tenn.; Dr. Harry S. Gradle, Chicago; Dr. R. S. Irvine, San Francisco; and Dr. Lawrence T. Post, St. Louis.

Because of existing conditions incident to the war, this committee has not completed its plans. When it is possible for the committee to perfect the necessary organization of committees in various states and compile necessary data, official reports will be submitted to the Board of Trustees and, through the Board, to the House of Delegates.

Supplementary Report

A supplementary report dealing with various matters referred to the Board of Trustees by the House of Delegates, which cannot be prepared in time for inclusion in the Handbook, will be submitted to the House of Delegates at this meeting. Other

matters referred to the Board of Trustees are covered in sections of this Report of the Board of Trustees pertaining to the activities of councils and bureaus.

ADDENDA TO REPORT OF BOARD OF TRUSTEES

Report of the Committee on Scientific Research for 1942

In 1942 thirty-one new grants have been made, amounting to \$14,980 in response to forty applications. Thirty-five grants have been closed. In all cases full accounting has been made of the finances. In the case of twenty-four of these grants reports of results of the work have been published or arrangements made for their publication. In the case of eleven closed

FINANCIAL STATEMENT FOR 1942

Balance Jan 1, 1942	\$ 9,404.61
Appropriation for 1942	13,700.00
Special Cardiac Research Fund	1,000.00
Refund grant 445	61.70
Refund grant 481	15.22
Refund grant 510	58.38

Committee travel expense	287.70
	\$15,867.70
Balance December 31, 1942	\$ 9,791.98

grants (nine grants) no results have been published. On account of the war three grants were closed shortly after payment (grants 639, 642 and 645, 1942). The work under forty-one grants prior to 1942 is incomplete in most cases active

work is in progress and in many cases reports have been published. In some cases work has been interrupted by war service. Certain research aided by grants from the committee is now carried forward by governmental agencies. During the year, unexpended balances of twelve grants have been refunded.

Special Cardiac Research Fund—A donor, who must remain unnamed, has placed a special fund of \$1,000 in charge of the committee to aid cardiac research by young physicians in medical practice (see grants 642 and 643, 1942).

The financial summary for 1942 is presented, also brief accounts of the grants closed during the year, of pending grants from previous years and a list of the grants made in 1942.

GRANTS OF COMMITTEE ON SCIENTIFIC RESEARCH
NEW GRANTS—1942

Grant 623 Catherine Macfarlane Woman's Medical College of Pennsylvania \$2,500 value of periodic pelvic and breast examination in detecting cancer. See grants 494 and 536 1938 and 1939.

Grant 624 Hrus Popper Cook County Graduate School of Medicine Chicago \$300 vitamin A in tissues. See grant 604 1941.

Grant 625 Fred Rohdiche University of Chicago \$500 study of chemotherapeutic agents on intestinal flora in infectious conditions.

Grant 626 Peter P. H. de Bruyn University of Chicago \$400 study of osteogenic substance in laying birds.

Grant 627 Francis J. Braceland Loyola University School of Medicine Chicago \$500 carbohydrate disturbances in schizophrenia.

Grant 628 Robert P. Ball Columbia University \$500 roentgen pelvimetry. Grant not paid because grantee entered military service.

Grant 629 Daniel J. Gloniet Des Moines Iowa \$500 cardiac conduction—disturbances of ventricular conduction.

Grant 630 Wesley W. Spink University of Minnesota \$300 nutrition and immunology of staphylococci.

Grant 631 L. R. Cercedo Fordham University \$500 vitamin B deficiency of rats and mice.

Grant 632 A. M. Lassek Medical College of South Carolina \$300 retrograde degeneration in the pyramidal tract. See grant 593 1940.

Grant 633 Oliver P. Jones University of Buffalo \$250 effect of antianemic principle on embryonic blood cells.

Grant 634 I. M. Tarlov Jewish Hospital Brooklyn \$500 study of plasma clot in suture of nerves in monkeys.

Grant 635 Reginald Fitz Peter Bent Brigham Hospital Boston, \$200 how does hyperthyroidism begin clinically?

Grant 636 A. McGhee Harvey Vanderbilt University School of Medicine \$500 secretion of thymus.

Grant 637 John R. Paine University of Minnesota \$620 study of oxygen poisoning.

Grant 638 Charles W. Turner University of Missouri \$600 mechanism of lactation.

Grant 639 Ben Vidgoff University of Oregon Medical School \$350 morphology of endocrine and secondary sex organs in male white rat.

Grant 640 Barnett Sure University of Arkansas \$400 vitamin B complex. See grant 601, 1941.

Grant 641 Paul Thomas Young University of Illinois \$500 appetite and food preferences in the rat. See grant 619 1941.

Grant 642 Deborah V. Dauber Michael Reese Hospital \$500 atherosclerosis in the chick (Cardiac Research Fund).

Grant 643 Milton Mendlowitz Mount Sinai Hospital New York \$500 digital circulation (Cardiac Research Fund).

Grant 644 Jacob Rabinovitch Jewish Hospital Brooklyn \$240 effect of heparin on thrombosis.

Grant 645 Robert M. Virtue University of Denver \$200 sulfur metabolism in cystinuric dogs.

Grant 646 Frederick M. Allen New York Medical College \$500 local refrigeration in surgery. See grant 615 1941.

Grant 647 Walter Schiller Cook County Hospital Chicago \$250 ovarian tumors. See grant 532 1939.

Grant 648 Meyer M. Harris New York State Psychiatric Hospital \$250 further research on muscular disease. See grant 606 1941.

Grant 649 Arthur H. Smith Wayne University College of Medicine Detroit \$200 metabolism of citric acid. See grant 606 1941.

Grant 650 Tuberculosis Committee Minnesota State Medical Association I. A. Myers chairman \$1,000 tuberculosis survey of Meeker County, Minn.

Grant 651 Roger M. Reinecke University of Minnesota \$300 carbohydrate metabolism of the kidney.

Grant 652 Oliver P. Jones University of Buffalo \$570 erythropoietic action of extract of human stomach. See grant 633 1942.

Grant 653 Ulrich Friedemann Jewish Hospital Brooklyn \$750 types of tetanus toxin. See grant 583 1940.

STATE OF GRANT-AIDED WORK

I. GRANTS CLOSED DURING THE YEAR

A. RESULTS PUBLISHED OR READY FOR PUBLICATION

Grant 474 1937 Marion Fry Woman's Medical College of Pennsylvania \$75 biochemistry of strontium. See grant 552 1939. Fay Marion Andersch M. A. and Behrmann V. G. The Biochemistry of Strontium. *J. Biol. Chem.* 144: 383 1942.

Grant 445 1937 Paul M. Levin Johns Hopkins University \$250 cerebral efferent tracts in primates. Refund \$61.70. Levin P. M. A. Nervous Structure in the Pineal Body of the Monkey. *J. Comp. Neurol.* 68: 405 1938. Levin P. M. and Bradford F. K. The Efferent Origin of the Corticospinal Tract in the Monkey. *ibid.* 68: 411 1938.

Grant 503 1938 R. C. Robb Syracuse University College of Medicine \$800 diseases in twins. The results will be published in a monograph.

Grant 510 1938 Emma A. Smith Iowa State College \$150 influence of various substances on gastrointestinal motility. Refund \$58.38. Smith Emma A. and Penrod K. E. Gastrointestinal Motility in the Albino Rat After Administration of Amphetamine Sulfate. *Proc. Soc. Exper. Biol. & Med.* 47: 418 1941.

Grant 532 1939 Walter Schiller Cook County Hospital Chicago \$200 ovarian tumors. Schiller Walter. Liver Cell Fat Necrosis Caused by Pancreatic Reflux. *Surg. Gynec. & Obst.* 72: 70 1941. Schiller Walter. The Histogenesis of Ovarian Mesonephroma. *Arch. Path.* 33: 443 1942. See grant 647 1942.

Grant 539 1939 Albert V. Hardy Columbia University \$500 Shigella dysenteriae. Hardy A. V. The Mouse Mucin Test in the Study of Shigella to be published in *Public Health Reports*.

Grant 552 1939 Marion Fay Woman's Medical College of Pennsylvania \$250 biochemistry of strontium. See grant 474 1937. Fay Marion. Behrmann V. G. and Buck D. M. The Parathyroids and the Clearance of Inorganic Phosphate. *Am. J. Physiol.* 136: 716 1942.

Grant 560 1939 B. S. Kline and H. P. Lankelma Western Reserve University \$500 chemical study of antigens. Wellman J. W. and Lankelma H. P. Purification of the Antigen of Syphilis. *Pen. Dis. Inform.* 22: 12 1941.

Grant 562 1939 Joseph H. Roe George Washington University \$350 vitamin C requirements of man. Kuether Carl A. and Roe J. H. Determination of Ascorbic Acid in Whole Blood. *Proc. Soc. Exper. Biol. & Med.* 47: 467 1941. Roe J. H., Hall J. M. and Dyer H. M. Relation of Nutrition to Gastric Function. II. The Effect of Vitamin C Deficiency. *Am. J. Digest. Dis.* 8: 261 1941. See grant 507 1938. Report of Committee for 1940.

Grant 579 1940 Harry C. Rolnick Michael Reese Hospital Chicago \$200 effect of trauma on the response of the kidney to sudden blockade. Sobin S. S., Aronberg L. M. and Rolnick H. C. The Nature of the Renal Lesion Caused by the Sulfonamides and Its Prevention with Urea. Accepted for publication by *American Journal of Pathology*.

Grant 585 1940 Howard Curl University of Tennessee \$400 roentgenologic study of the normal gallbladder. Curl Howard. High Fat Diet Preceding Cholecystography: A Review of the Literature and Experimental Studies on Filling the Normal Gallbladder. *J. A. M. A.* 119: 607 1942.

Grants 590 and 597 1940 David Polowe Paterson N. J. \$150 and \$100 pancreatic function test. See grant 597 1940. Polowe D., Rati H. H. D. and Bullowa J. G. M. Measurement of Blood Amylase Activity by Cuprous Oxide Precipitation. *Am. J. Clin. Path.* 12: 62 1942.

Grant 593 1940 A. M. Lassek Medical College of the State of South Carolina \$300 origin of the pyramidal tract in the monkey. Lassek A. M. The Effect of Pre and Postcentral Cortical Ablations on the Fibers of the Pyramids in Monkeys. *J. Ner. & Ment. Dis.* 95: 721 1942. See grant 632 1942.

Grant 596 1940 Israel Davidsohn Mount Sinai Hospital Chicago \$400 bacteriogenic hemagglutination. See grant 569 1940. Davidsohn I. and Tshirsky B. Bacteriogenic Hemagglutination. II. *J. Immunol.* 47: 213 1942.

Grant 600 1941 W. R. Tweedy Loyola University School of Medicine Chicago \$125 effect of magnesium deficient diet on serum phosphatase activity in albino rat. Snyder F. H. and Tweedy W. R. The Effects of a Magnesium Deficient Diet on the Serum Phosphatase Activity in the Albino Rat. accepted for publication by *Journal of Biological Chemistry*.

Grant 601 1941 Barnett Sure Agricultural Experimental Station Fayetteville Ark. \$600 new factor in vitamin B complex essential for reproduction and lactation. See grant 640 1942. Sure Barnett. Dietary Requirements for Fertility and Lactation. XXX. Role of p-Aminobenzoic

Acid and Inositol in Lactation *Science* **94** 167 1941 Dietary Requirements for Fertility and Lactation XXIX The Existence of a New Dietary Factor Essential for Lactation *J Nutrition* **22** 499, 1941

Grant 604 1941 Hans Popper Cook County Graduate School of Medicine Chicago \$350 study of vitamin A and lipoids by fluorescence microscopy See grant 624 1942 Meyer Karl A Popper Hans and Ragins A B Histologic Distribution of Vitamin A in Biopsy Specimens of the Liver *Arch Surg* **43** 376 1941 Popper Hans and Chinn Herman Changes of Vitamin A Distribution in Choline Deficiency *Proc Soc Exper Biol & Med* **49** 202 1942 Popper Hans and Brenner Sadie The Fate of Vitamin A Stores During Depletion Value of the Histologic Demonstration of Vitamin A *J Nutrition* **23** 431 1942 Cornbleet Theodore and Popper, Hans Properties of Human Skin Revealed by Fluorescence Microscopy The Normal Skin the Vitamin A Content of the Skin *Arch Dermat & Syph* **46** 59 1942 Popper Hans Steigmann Frederick and Dynowicz H A Distribution of Vitamin A in Experimental Liver Damage *Proc Soc Exper Biol & Med* **50** 266 1942 Meyer K A Popper Hans, Steigmann Frederick, Walters W H and Zevin Sol Comparison of Vitamin A of Liver Biopsy Specimens with Plasma Vitamin A in Man *ibid* **10** 589 1942

Grant 606 1941 Meyer M Harris Psychiatric Institute New York \$250 food factors in muscular disease See grant 648 1942 Harris M M Negative Therapeutic and Metabolic Effects of Synthetic Alpha Tocopherol (Vitamin E) in Muscular Dystrophy *Am J Med Sc* **202** 258 1941

Grant 610 1941 H O Burdick Alfred University Alfred N Y, \$125 the effect of desoxycorticosterone acetate on pregnancy Burdick H O Effect of Progesterone on the Ovaries and Embryos of Mice in Early Pregnancy *Endocrinology* **30** 619 1942

Grant 614 1941 George Gomori University of Chicago \$400 enzymes in tissue sections Gomori George Histochimical Reactions on Lipid Aldehydes and Ketones accepted for publication by *Proceedings of the Society for Experimental Biology and Medicine* Calcification and Phosphatase accepted for publication by *American Journal of Pathology*

Grant 615 1941 Frederick M Allen New York Medical College \$500 reduced temperatures in surgery Allen F M Reduced Temperatures in Surgery III Experiments on Pelvic and Abdominal Refrigeration with Especial Reference to Traumatic and Military Surgery *Am J Surg* **55** 451 1942 See grant 646 1942

Grant 618 1941 H M Weaver Wayne University College of Medicine \$200 pain on distention of the stomach Refund \$0.13 Weaver H M Pathways for Pain from the Stomach in the Dog accepted for publication by *Archives of Neurology and Psychiatry*

Grant 622 1941 Timothy Ierry Office of Medical Examiner Boston \$75 illustrations for article on atherosclerosis See grant 471 1937 Ierry Timothy The Genesis of Atherosclerosis *Arch Path* **32** 507 1941

B No RESULTS PUBLISHED

Grant 254 1932 J Lisle Williams Rush Medical College Chicago \$200 decreased dextrose tolerance in acute infectious diseases

Grants 310 1934 and 462 1937 Iry Martin Johns Hopkins University \$150 and \$200 gastric juice The research is receiving support from other sources

Grant 355 1935 Royall M Calder San Antonio, Texas \$150 mechanism of pneumococcal inflammation

Grant 480 1937 Amy I Daniel State University of Iowa \$250 relation of fluorine to physiologic function Illness prevents completion of the work

Grants 527 1938 and 577 1940 Alexander Levy University of Oregon Medical School \$300 and \$200 collateral circulation in occlusion of the coronary arteries

Grant 542 1939 Kendall B Corbitt University of Tennessee \$200 alterations in the hip after denervation No changes were noted in partially denervated shoulder or hip joints of monkeys kept for periods varying to as long as eighteen months in duration The monkeys gradually died of tuberculous infection Under the circumstances and because of the possibility that positive results might appear in animals kept for a longer time it is thought best to postpone publication of the results until further experiments can be carried out

Grant 639 1942 Ben Vidgoff University of Oregon Medical School \$350 morphology of endocrine and secondary sex organs of male white rat Grant returned because increase in teaching prevents research

Grant 643 1942 Milton Mendlowitz Mount Sinai Hospital New York \$500 digital circulation (Special Cardiac Research Fund) Grantee in military service Refund \$446.57

Grant 645 1942 Robert M Virtue University of Denver \$200 sulfur metabolism in cystinuric dogs Grant returned because necessary animal quarters could not be obtained

2 WORK IN PROGRESS

Grant 441 1937 Edward S West and G E Burget University of Oregon Medical School \$350 diuretic action and chemical metabolism of sorbitol Todd W R Myers J and West E S On the Metabolism of Sorbitol and Mannitol *J Biol Chem* **127** 275 1939

Grant 479 1937 Tracy J Putnam Boston City Hospital \$200 injuries to the cervical portion of the cord

Grant 481 1937 Warren O Nelson Wayne University College of Medicine \$200 synthetic androgenic substances

Grant 504 1938 Wallace M Yater Georgetown University Medical School \$500 histopathology of bundle branch block

Grant 518 1938 Harold D West Meharry Medical College \$100 synthesis of *dl* threonine See grant 559 1939

Grant 522 1938 Ludwig A Imge Stanford University School of Medicine, \$500 relation of sex hormones to tumor growth

Grant 533 1939 Hardy A Kemp and W M Fisher Baylor University \$500 venom of southern and southwestern scorpions

Grant 536 1939 Catharine Macfarlane Woman's Medical College of Pennsylvania \$1900 value of periodic pelvic examination in detecting cancer of the uterus See grants 494 1938 and 623, 1942 Macfarlane Catharine, Fetterman Ruth S and Sturges Margaret C Report of an Experiment in the Control of Cancer of the Uterus *Quart Rev New York City Cancer Committee* 1941 Macfarlane Catharine Progress Report on Experiment in Control of Cancer of the Uterus *Connecticut State M J* **5** 814 1941 Macfarlane Catharine Precancerous Lesions of Uterine Cervix *M Woman's J* July 1941 Scott Flemer Analysis of Lesions of the Cervix Discovered in Periodic Pelvic Examinations of 955 Women *M Woman's J* December 1941 Macfarlane Catharine, Sturges Margaret C and Fetterman Ruth S Report of an Experiment in the Control of Cancer of the Uterus *Pennsylvania M J* **15** 348 1942

Grant 559 1939 Harold D West Meharry Medical College \$50 synthesis of *dl* threonine See grant 518 1938

Grant 567 1940 Armand J Quick Marquette University \$275 conversion of prothrombin to thrombin Quick A J Prothrombin Concentration of the Blood in Various Species *Am J Physiol* **132** 239 1941 Quick A J Effect of Air Currents on Plasma Prothrombin *Proc Soc Exper Biol & Med* **50** 317 1942

Grant 570 1940 William H Sweet University of Chicago \$300 course of nerve fiber tracts of the temporal lobe

Grant 571 1940 Joseph T King University of Minnesota \$280 antagonistic effect of tissues on the action of sulfanilamide Jensen N A and Nelson M C Local Sulfanilamide in Compound Fractures *Surg Gynec & Obst* **75** 34 1942

Grant 574 1940 A C Linton Louisiana State University \$300 absorption and metabolism of amino acids Linton A G and Doty J R The Heat Production and Blood and Urine Constituents After Administration of L(-) Histidine to the Dog *J Nutrition* **21** 25 1941

Grant 576 1940 Edward S West University of Oregon Medical School \$250 solution of vesical calculus

Grant 582 1940 Charles W Greene Stanford University \$500 physiology of the coronary system in monkeys

Grant 583 1940 Ulrich Friedemann Jewish Hospital of Brooklyn \$300 genesis of tetanus Friedemann Ulrich Hollander A and Farlow I M Investigations of the Pathogenesis of Tetanus III *J Immunol* **10** 325 1941 See grant 553 1942

Grant 584 1940 Oscar V Batson University of Pennsylvania \$200 myasthenia

Grant 591 1940 Percival Bailey University of Illinois \$500 effects of electroshock lesions in the periaqueductal gray matter of the Miacus monkey Bailey Percival and Davis F W Effects of Lesions of Periaqueductal Gray Matter in the Cat *Proc Soc Exper Biol & Med* **51** 305 1942 The Syndrome of Obstinate Progression in the Cat *ibid* p 307

Grant 594 1940 I L Chirikoff University of California \$350 phospholipid metabolism and blood regeneration as measured by radioactive phosphorus

Grant 595 1940 Arthur C Allen Mount Sinai Hospital New York \$250 effect of chemicals on vegetations of experimental endocarditis Refund \$148.86

Grant 599 1941 William H Welker University of Illinois College of Medicine \$350 water soluble proteins

Grant 603 1941 Norris J Heckel Rush Medical College Chicago \$250 effect of sex hormones on seminal fluid

Grant 605 1941 Harry G Day Indiana University \$400 physiologic significance of zinc

Grant 607 1941 Fritz Levy Davis Memorial Hospital Elkins W Va \$250 study of marrow cells

Grant 608 1941 Everett J Evans Medical College of Virginia \$500 problems in surgical shock

Grant 609 1941 C E Chubronner University of Illinois College of Medicine \$300 bacterial metabolism

Grant 611 1941 M R Todd University of Oregon Medical School \$200 the physiologic effects of canine distemper vaccine

Grant 612, 1941 Roland K Meyer University of Wisconsin \$500 antihormones Meyer R K Kupperman H S and Finerty J C Increase in Gonadotropic Content of Pituitary Glands of Female Rats Treated with Antigonadotropic Serum *Endocrinology* **30** 662 1942

Grant 613 1941 Robert W Virtue University of Denver \$200 formation of cholic acid See grant 499 1938 report for 1940

Grant 616 1941 Robert S Dow University of Oregon Medical School \$250 effects of clotting in cerebral veins

Grant 617 1941 Mary John, University of Maryland College of Medicine \$500 tests of applicability of feather germ reaction to tumor diagnosis

Grant 620 1941 T T Chen University of California, \$150, illustrations of malarial parasites

Grant 619 1941 Paul Thomas Young, University of Illinois \$500 appetites and food preferences in the rat See grant 611 1942

Grant 621 1941 William M Cahill Wayne University College of Medicine \$175 self selection of food in relation to tumor growth

Report of the Committee on Therapeutic Research

The Committee on Therapeutic Research, a standing committee of the Council on Pharmacy and Chemistry, encourages scientific investigations in the field of therapeutics by providing funds for the prosecution of necessary research.

During the year 1942 the committee issued twenty-seven new grants. A detailed list of these grants, together with a list of publications during 1942 and of unexpended grants made before Jan 1, 1942 are included in this report.

The following is a list of the investigations conducted with the assistance of grants made by the Committee on Therapeutic Research, reports of which were published during 1942.

Chemotaxis Marion McCutcheon *Irish Path* 74 167 (July) 1942

The Fundamental Characteristics of Local Anesthetics R Bentner B Calsenick and I Lippincott *Anesthesiology* 6 673 (Nov) 1942

The Vasomotor Components in the Vascular Reactions in the Finger to Cold Alrick B Hertzman and Laurence W Roth *Am J Physiol* 136 669 (June) 1942

The Reactions of the Digital Artery and Minute Pad Arteries to Local Cold Alrick B Hertzman and Laurence W Roth *Am J Physiol* 136 680 (June) 1942

The Absence of Vasoconstrictor Reflexes in the Forehead Circulation Effects of Cold Alrick B Hertzman and Laurence W Roth *Am J Physiol* 136 692 (June) 1942

A Therapeutic Incompatibility Between Sulfapyridine and Quinine Ben King Harned and Vera V Cole *J Pharmacol & Exper Therap* 74 42 (Mar) 1942

The Effects of a Diet Deficient in Vitamin B on the Toxicity of Sulfapyridine Vera V Cole and Ben King Harned *Federation Proc* 1 147 (March) 1942

Effect of Fetrone on Prothrogen Content in Pituitary and Blood of Male Rabbits Joseph Meites and C W Turner *Proc Soc Exper Biol & Med* 40 190 1942

Lactogenic Content of Pituitaries of Pseudopregnant Rabbits Joseph Meites and C W Turner *Proc Soc Exper Biol & Med* 49 193 1942

Prothetin Abraham White Roy W Bonsnes and C N H Long *J Biol Chem* 143 447 (April) 1942

Statistical Studies on the Effects of Anesthetics in the Intravenous Cat Method of Standardizing Digitalis Harold G O Holck E J Smith R H Shuler R Van Norman D R Mathieson and J Dahlstedt *Federation Proc* 1 154 (March) 1942

Effects of Testosterone Acetate and Propionate and of Estradiol Dipropionate on the Resistance of the Rat to Exipal Sodium Arostal Pernoston and Pentobarbital Sodium Harold G O Holck Donald R Mathieson Edwin I Smith and Lewis D Fink *J Am Pharm A* (Scient Ed) 31 116 (April) 1942

The Effect of Some Organic Solvents on the Hormones of the Posterior Lobe of the Hypophysis John A Vachulis *Federation Proc* 1 170 (March) 1942

Effects of Cocaine and Sympathomimetic Amines on Humoral Transmission of Sympathetic Nerve Actions W S Lawrence M C Morton and M L Tainter *J Pharmacol & Exper Therap* 75 219 (July) 1942

Tryptophan Metabolism Raymond Borchers Clarence P Berg and Newton E Whitman *J Biol Chem* 145 657 (Oct) 1942

The Arsenic Analogue of Choline as a Component of Lecithin in Rats Fed Arsenocholine Chloride A D Welch and R L Landau *J Biol Chem* 144 581 (Aug) 1942

Effects of Asphyxia Anoxia and Myocardial Ischemia on the Coronary Blood Flow Harold D Green and Rene Wegria *Am J Physiol* 135 271 (Jan) 1942

Relative Increase in Chloride Excretion in the Dog After Graded Doses of Mercurial Diuretics Charles C Roly and Carl Pfeiffer *Am J Physiol* 135 591 (Feb) 1942

Influence of Diet on Action of the Sulfonamide Drugs Esther M Greisheimer Roberta Hafkesbrung and Grace E Wertenberger *Proc Soc Exper Biol & Med* 51 143 1942

Emetic Responses of Glycosides as Evidence of Their Cumulation and Synergistic Action in the Central Nervous System Melvin Dresbach *Federation Proc* 1 22 (March) 1942

Redistribution of Body Fluids After Glucose Injections in Rats with Adrenocortical Transplants Leland C Wyman and Caroline tum Suden *Endocrinology* 31 295 (Sept) 1942

The Pharmacological Actions of Parenterally Administered Magnesium Salts A Review Paul K Smith Alexander W Winkler and Hebbel E Hoff *Anesthesiology* 3 323 (May) 1942

Absence of Beneficial Effects from Injections of Desoxycorticosterone Acetate and of Cortical Adrenal Extract in Experimental Anuria Alexander W Winkler Paul K Smith and Hebbel E Hoff *J Clin Invest* 21 419 (July) 1942

Intravenous Magnesium Sulfate in the Treatment of Nephritic Convulsions in Adults Alexander W Winkler Paul K Smith and Hebbel E Hoff *J Clin Investigation* 21 207 (March) 1942

Heparin as an Antidote to Trypsin in the Rat Carl A Dragstedt J A Wells and M Rocha e Silva *Federation Proc* 1 149 (March) 1942

Inhibitory Effect of Heparin on Histamine Release by Trypsin Antigen and Protease Carl A Dragstedt J A Wells and M Rocha e Silva *Proc Soc Exper Biol & Med* 51 191 1942

A Comparison of the Disposition of Injected Glucose in Two Strains of Rats James M Orten and George Sayers *J Biol Chem* 145 123 (Sept) 1942

The Direct Mammotrophic Action of Lactogenic Hormone William R Lyons *Proc Soc Exper Biol & Med* 51 308 1942

Further Ballistic Studies on Cardioaortic Hydraulic Models Philip Dow and W F Hamilton *Federation Proc* 1 21 (March) 1942

The Recoil Curves of the Circulation in Three Dimensions W F Hamilton and Philip Dow *Federation Proc* 1 36 (March) 1942

Blood Pressure Studies in Patients Undergoing Convulsive Therapy Hervey Cleckley W P Hamilton R A Woodbury and P P Volpitta *South M J* 35 375 (April) 1942

The Effects of Metrazol on the Blood Pressure of Man and Dog W P Hamilton R A Woodbury Hervey Cleckley and P P Volpitta *Hosp Bull (U of Ga)* 4 13 1942

Cure of Experimental Staphylococci Meningitis Ward J MacNeal Martha Jane Spence and Anne Blevins *Proc Soc Exper Biol & Med* 50 176 1942

Staphylococemia 1931 1940 Five Hundred Patients Ward J MacNeal Frances C Frisbee and Margaret A McRae *Am J Clin Path* 12 281 (June) 1942

Mechanism of Pentothal Sodium Antidiuresis Herbert Silvette *Arch Int Med* 70 567 (Oct) 1942

Influence of Repeated Daily Exposure to Low Barometric Pressure on Urine Output Herbert Silvette *Proc Soc Exper Biol & Med* 51 199 1942

Effect of Alcohol on Postpituitary Antidiuresis Herbert Silvette *Federation Proc* 1 166 (March) 1942

Effect of Epinephrine and Pitressin on the Coronary Artery Inflow in Anesthetized Dogs Harold D Green Rene Wegria and Norman H Boyer *J Pharmacol & Exper Therap* 76 378 (Dec) 1942

Sulfonamides and the Blood pH Grace E Wertenberger *Proc Soc Exper Biol & Med* 51 145 1942

During 1942 the following grants were made

Grant 466 Dr R H Rigdon associate professor of pathology University of Tennessee \$100 to prepare a movie of a clinical case of malaria with the pathologic changes

Grant 467 Dr R C de Bodo associate professor of pharmacology New York University College of Medicine \$500 the antidiuretic action of the narcotics

Grant 469 Dr Harry Beckman professor of pharmacology Marquette University School of Medicine \$250 the possibilities of massive continuous therapy in malaria

Grant 470 Dr Herbert Silvette assistant professor of pharmacology University of Virginia Medical School \$275 the effect of low atmospheric pressures on the action of drugs

Grant 471 Dr W F Hamilton professor of pharmacology and physiology University of Georgia School of Medicine \$125 the cardiovascular pressures in unanesthetized animals and in man by means of the hypodermic manometer

Grant 472 Dr Robert V Brown associate professor of physiology and pharmacology University of North Dakota \$150 action of pilocarpine on bile secretion

Grant 473 Dr Richard C de Bodo associate professor of pharmacology New York University College of Medicine \$500 temporary and permanent effects of insulin on carbohydrate metabolism with special reference to its effects on epinephrine hyperglycemia and liver glycogenolysis

Grant 474 Dr Arthur C DeGraff professor of therapeutics New York University College of Medicine \$400 effectiveness of sodium thiosulfate and sodium formaldehyde sulfoxalate in treatment of cardiac arrhythmias induced experimentally by mercurial diuretics

Grant 475 Dr Esther M Greisheimer professor of physiology Woman's Medical College of Pennsylvania \$250 effects of sulfonamide drugs on certain phases of carbohydrate metabolism and blood pH

Grant 476 Dr Roberta Hafkesbrung associate professor of physiology Woman's Medical College of Pennsylvania \$200 effects of various sulfonamide drugs on the electrocardiograms of dogs

Grant 477 Dr Harold C Hodge assistant professor of biochemistry and pharmacology University of Rochester School of Medicine and Dentistry \$200 acute toxicity of choline

Grant 478 Dr Stacy R Mettler associate professor of medicine University of California Medical School \$400 the pH factor in blood transfusion and other immunologic aspects of blood grouping

Grant 479 Dr Mayo H Soley assistant professor of medicine and pharmacology University of California Medical School \$350 treatment of patients with toxic diffuse goiter by means of radioactive iodine

Grant 480 Dr J Murray Luck professor of biochemistry Stanford University \$500 concentration of the B vitamins in liver of the soupfin shirk

Grant 481 Dr W J MacNeal director of the laboratories of bacteriology New York Post Graduate Medical School and Hospital \$250 bacteriophage phenomenon and therapeutic application of bacteriophages

Grant 482 Dr W J MacNeal director of the laboratories of bacteriology New York Post Graduate Medical School and Hospital \$400 the therapy of experimental viridans endocarditis

Grant 483 Dr Donald Slaughter professor of pharmacology and physiology University of Vermont College of Medicine \$150 effects of sulfonamides on the regeneration of visual purple

Grant 484 Drs Alfred Goerner associate professor of biological chemistry Long Island College of Medicine and M Margaret Goerner pathologist Brooklyn Thoracic Hospital \$400 toxic action of carcinogenic compounds on liver tissues

Grant 485 Dr Carl W Walter laboratory of surgical research Harvard Medical School \$250 for construction of a hydrogen ion potentiometer to be used for studies on (a) the mobilization and deposition of bone calcium by electrolysis (b) animal tissue response to metallic magnesium and its alloys

Grant 486 Dr Lawrence W Smith professor of pathology Temple University School of Medicine \$480 the effects of chlorophyll and other substances on tissue cultures and wound healing

Grant 487 Dr Harold Holck associate professor of pharmacology University of Nebraska College of Pharmacy \$175 the relation of sex to drug action

Grant 488 Dr L R Kaufman director of surgery New York Medical College \$125 circulatory competence of the gut in cases of intestinal obstruction

Grant 489 Dr L R Kaufman director of surgery New York Medical College \$100 use of enzyme mixture for dissolving slough

Grant 490 Dr Andrew F Burton assistant professor of pharmacology Howard University School of Medicine \$698 the distribution of sulfanilamide and the toxic effects of quinine

Grant 491 Dr Fred D Weidman vice dean for dermatology and syphilology University of Pennsylvania Graduate School of Medicine \$500 the control of dermatophytosis and value of living *Bacillus subtilis* cells

Grant 492 Dr Abraham White assistant professor of physiologic chemistry Yale University School of Medicine \$200 the hormones of the anterior pituitary gland

The following grants were issued before Jan 1 1942 In some cases the grant has expired and an unexpended balance remains or the work is not yet completed or not yet published

Grant 164 E L Jackson associate professor of pharmacology Emory University School of Medicine \$200 to investigate the antagonism between sodium barbital and insulin

Grant 232 George R Cowgill associate professor of physiology chemistry Yale University School of Medicine \$250 to investigate the heart in vitamin B deficiency

Grant 238 Roy R Kracke professor of pathology Emory University School of Medicine \$250 to investigate the effect of the oxidation products of aminopyrine and related drugs on the leukocyte counts of rabbits

Grant 264 Detlev W Bronk Johnson professor of biophysics University of Pennsylvania School of Medicine \$200 to investigate the action of various drugs on the autonomic centers

Grant 280 John P Peters professor of medicine Yale University School of Medicine \$200 to investigate by means of intravenous pyelography the state of the ureters and kidneys in a large series of patients after delivery and subsidence of acute signs of toxemia

Grant 297 Melvin Dresbach Harvard University School of Medicine \$250 to investigate the emetic effect of some of the digitalis bodies

Grant 306 Edwards A Park professor of pediatrics Johns Hopkins University School of Medicine \$75 to investigate rickets in the rat and the effect of solution of parathyroid on the circulation of the bone

Grant 355 Peter K Knoefel associate professor of pharmacology University of Louisville School of Medicine \$150 to investigate the action of amines of the epinephrine series and of related substances on the central nervous system

Grant 356 John B Lagen research associate in medicine University of California Medical School \$150 to investigate the potassium and sodium ions in the blood of asthmatic patients and in anxiety states

Grant 375 Joseph Seifter Department of Pharmacology Western Reserve University School of Medicine \$250 to investigate the pharmacology of metal alkyls

Grant 391 A R McIntyre professor of physiology and pharmacology University of Nebraska College of Medicine \$100 to investigate ovarian and cardiac muscle and metabolism

Grant 404 Carl Pfeiffer Department of Pharmacology Wayne University College of Medicine \$300 to investigate caffeine withdrawal headaches

Grant 408 Ephraim Shorr assistant professor of medicine Cornell University Medical College \$300 to investigate the effect of progesterone on the vaginal smear

Grant 411 Linn J Boyd professor of pharmacology New York Medical College \$300 to investigate the effects of hypnotics on mercurial diuretics

Grant 412 Anne Forbes Massachusetts General Hospital Boston \$400 to investigate the effect of various endocrine diseases and the administration of various endocrine products on the 17 ketosteroid secretion in the urine

Grant 413 Claude E Forkner New York Hospital Department of Medicine \$300 to investigate bronchiectasis etiology and treatment

Grant 417 H E Huf assistant professor of physiology A W Winkler instructor in medicine and P K Smith research assistant in pharmacology and toxicology Yale University School of Medicine \$250 to investigate the action of ions

Grant 419 Thomas H McGavack New York Medical College \$300 to investigate the action of lipocaine and pancreatic extracts

Grant 423 Treat B Johnson professor of organic chemistry Yale University School of Medicine \$250 to investigate pyrimidines

Grant 430 J P Simonds Department of Pathology Northwestern University Medical School \$100 to investigate the selective action of different types of poisons on the kidneys

Grant 437 M L Tainter professor of pharmacology Stanford University School of Medicine \$250 to investigate sympathomimetic amines

Grant 438 George I Munson assistant professor of physiology Wayne University College of Medicine \$200 to investigate the effect of certain drugs on the strength of skeletal muscle

Grant 442 Morton McCutcheon associate professor of pathology University of Pennsylvania School of Medicine \$150 to investigate cellular locomotion

Grant 443 A B Baker assistant professor of neuropsychiatry and neuropathology and Raymond N Baker professor of pharmacology University of Minnesota Medical School \$500 to investigate toxic effects of sulfanilamide and derivatives on nervous system and effect of vitamin B complex in prevention of such injuries

Grant 445 Linn J Boyd professor of physiological chemistry and John R Trotter instructor in physiological chemistry University of Arkansas School of Medicine \$300 to investigate ocular manifestations of triptophan deficiency

Grant 446 Carl A Drysdale professor of pharmacology Northwestern University Medical School \$100 to investigate the effect of heparin on electrolyte and related phenomena

Grant 449 Arvid B Hartman professor of physiology St Louis University School of Medicine \$500 to investigate peripheral circulation

Grant 450 Linn J Boyd professor of pharmacology and David Scherf associate clinical professor of medicine New York Medical College \$50 to investigate the effect of triptophan in paroxysmal tachycardia

Grant 453 Amleto S Marrazzi assistant professor of pharmacology New York University College of Medicine \$500 to investigate sympathomimetic amines

Grant 454 W L Mendenhall professor of pharmacology and Albert J Hammer assistant professor of pharmacology Boston University School of Medicine \$50 to investigate the quantitative determination of theophylline

Grant 455 Frederick H Pratt professor of physiology and Marion A Reil instructor in physiology Boston University School of Medicine \$100 to investigate the effect of cardiac drugs on the denervated lymphatic heart

Grant 456 H Morrow Sweeney professor of physiology and pharmacology University of South Dakota \$100 to investigate the effects and mode of action of certain drugs with anesthetic properties namely amphetamine and metrazol after morphine and sodium pentobarbital respectively

Grant 457 Edward C Wynn assistant professor of physiology Boston University School of Medicine \$172.50 to investigate the factors controlling the growth and functional efficiency of transplanted adrenal cortical tissue

Grant 458 George Fair professor of internal medicine University of Minnesota \$100 to investigate the effect of guanacoumarin C on certain types of heart disease

Grant 459 Mary F O'Sullivan Bellevue Hospital \$100 to investigate the therapeutic effect of a radical in muscular dystrophy

Grant 462 B K Harrod professor of pharmacology and Hughbert C Hamilton associate professor of physiology Women's Medical College of Pennsylvania \$298 to investigate the effects of bromide administered to pregnant rats on the learning ability of the offspring

Grant 464 A J Nedzel associate professor of pathology University of Illinois College of Medicine \$300 to investigate the response of the animal body to drugs under different environmental conditions

Grant 465 L N Katz director of cardiovascular research Michael Reese Hospital \$200 to investigate the action of various steroids on capillary permeability

TREASURER'S REPORT

Report of the Treasurer of the American Medical Association for the Year Ended December 31, 1942

Investments (At Cost) as at January 1 1942	\$2 421 942 99
Bonds Purchased (At Cost)	239 904 49
	<u>\$2 661 847 48</u>
Less	
Bonds Called Matured or Sold	120 538 32
	<u>Investments as at December 31 1942</u>
	\$2 541 309 16
Balance for Investment January 1 1942	\$ 286 718 14
Interest Received on Investments—Year 1942	75 585 92

	<u>Funds on Deposit as at December 31 1942</u>
	\$7 614 03

HERMAN L KRETSCHMER Treasurer

AUDITOR'S REPORT

January 29, 1943

To the Board of Trustees,

American Medical Association, Chicago, Illinois

Dear Sirs:

We have examined the Balance Sheet of the American Medical Association, Chicago, Illinois, as of December 31, 1942, and the statement of income for the year ended on that date, have reviewed the system of internal control and the accounting procedures of the Association and, without making a detailed audit of the transactions, have examined or tested accounting records and other supporting evidence, by methods and to the extent we deemed appropriate except as hereinafter stated regarding confirmation of receivables and observation of the inventory taking.

The cash and bank balances have been confirmed by count or by certificates from the depositaries. The United States government and other marketable securities were confirmed by an acknowledgment from the Continental Illinois National Bank and Trust Company of Chicago, where the securities are held for safekeeping.

We did not independently confirm the accounts receivable by communication with the debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable. We reviewed the plan and system of control adopted for inventory taking but we did not observe the taking of the inventories nor did we make tests of the physical existence of the quantities recorded.

Expenditures charged to property and equipment accounts during the year in our opinion, were properly capitalized as representing additions or improvements. The provision for depreciation for the year appears to be adequate.

In our opinion, subject to the exceptions set forth in paragraph three, the accompanying Balance Sheet and related statement of income present fairly the position of the American Medical Association at December 31, 1942, and the results of the operations for the year based on the accounting procedures employed by the Association regarding which the following observations are submitted:

(a) In accordance with the established practice of the Association the accounts as stated do not include (a) unrecorded assets in respect of accrued interest on bond investments, and membership dues unpaid and (b) provision for accrued property taxes for the year 1942, and sundry unpaid bills and wages.

(b) Subscriptions paid in advance are stated at an estimated amount which is based on cash received in December 1942 on account of 1943 subscriptions. This procedure conforms to the method used in prior years.

(c) Advance payments on publications include an estimated amount (\$131,027.29) for prepaid subscriptions to *HIGIEN*, and the amount (\$15,075.81) received in advance for January 1943 advertising, directory information sales and service.

We have received a letter from Messrs. Loesch Scofield Loesch and Burke, attorneys for the Association, regarding litigation pending against the Association or its officers at December 31, 1942, which states that the following law suits had been filed:

Jean Paul Fernel—\$1,000,000 (libel)
William E. Balsinger—\$100,000 (libel)
Muriel Longini—\$1,000 (claim)
Wayne County Association of Physicians and Surgeons of Osteopathic Medicine, Inc.—\$100,000 (slander)

The attorneys state that in their opinion all of these suits will be defeated. The letter states also that the Supreme Court has affirmed the judgment of conviction against the Association in the case filed by the United States charging conspiracy in restraint of trade, the judgment was that the Association be sentenced to pay a fine of \$2,500.

Fidelity insurance is carried against the undermentioned officers and employees, in the amount stated:

Dr. Olin West Secretary and General Manager	\$10,000.00
Dr. Herman L. Kretschmer, Treasurer	10,000.00
E. A. Hoffman Cashier	10,000.00
J. E. Hartigan Assistant Cashier	2,000.00
Sundry Employees (thirteen \$1,000 each)	13,000.00
Total Fidelity Insurance	\$45,000.00

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for the proper conduct of the examination.

Yours truly,

PEAT, MARWICK, MITCHELL & Co

REPORT OF THE JUDICIAL COUNCIL

To the Members of the House of Delegates of the American Medical Association

The report of the Judicial Council will be submitted separately

REPORT OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

To the Members of the House of Delegates of the American Medical Association

The Council on Medical Education and Hospitals during the past year has been confronted with many perplexing problems in medical education

MEDICAL EDUCATION AND THE WAR EFFORT

As a preparedness measure the medical schools had early increased the size of their entering classes by approximately 10 per cent

On the entry of this country into the war the importance of providing as soon as possible an adequate supply of physicians for both the military and the civilian population was apparent. Thus the first step in this direction was the adoption by the medical schools of the country, with but three exceptions of an accelerated program providing for the completion of the usual four year medical course in three calendar years. It has been estimated that this program provides for the graduation of 4,455 students by March 31, 1943. By the end of the present year approximately 5,380 additional students will complete their medical college courses. The majority of medical students are at present in the Army or Navy Reserve Corps or in the advanced R O T C and will be eligible for commissions on graduation. However, all will be allowed one year from the date of their graduation to complete a year's internship in a hospital before being called to active duty.

In November 1942 the Council on Medical Education and Hospitals recommended that for the duration of the war the required premedical education including satisfactory courses in physics, biology and chemistry including organic chemistry, be included within two calendar years of instruction. Such a program is being adopted by practically all the medical schools of the country.

Although medical schools have been advised not to lower the standards of medical education in connection with their contribution to the war effort, it has been necessary for them to release for military duty many of their prominent faculty members while others are devoting their time to war research. Thus with greatly depleted staffs the medical schools are facing the difficult task of both increasing and speeding up the production of competent physicians.

The lowering of the draft age to 18 years and the program of the Army and Navy to place selected premedical and medical students on active duty to continue their medical education have introduced new problems. One of the greatest of these is that involving the present large pool of students who are at various levels of their premedical programs. Only a relatively small number of this group can be accommodated in the 1943 and 1944 entering classes of the medical schools of the country. In general, the 1943 entering classes have already been filled and the medical schools are now proceeding with the selection of students for their 1944 entering classes.

At present it would appear that the entire collegiate program of the Army is somewhat as follows:

Young men 18 years of age who are physically qualified will be inducted into the Army as privates and will be sent to camp for a preliminary period of training. During the period they are at camp they will be permitted to make application for assignment to a Specialized Collegiate Training Program. Students will probably be chosen for such programs on the basis of certain tests and decisions made by boards to be appointed for this purpose. All students assigned to such specialized collegiate training programs will be assigned to colleges with which the Army has contracts.

The Council on Medical Education and Hospitals in February 1943 approved the basic pattern of the proposed pre medical curriculum of the Army Specialized Training Program.

The premedical curriculum of the Navy, which will be offered in colleges with which the Navy has contracts, as at present arranged differs in certain respects from that of the Army and calls for a longer period of premedical study.

It is understood that the medical schools will participate in the selection of students for admission to the various medical schools.

The medical school curriculums under the Army and Navy training programs will remain entirely under the supervision of the individual schools, and it is understood that all approved medical schools may receive both Army and Navy men as students.

During their premedical and medical courses these students will be on active duty, subject to military regulations, and will be entirely supported by the federal government.

It is understood that premedical and medical students who now hold commissions in the Medical Administrative Corps of the Army may, if they desire, remain in their present status and proceed with their program of medical education at their own expense. It is understood that the Navy offers similar opportunities to students holding commissions Ensign H-V (P).

Officers of the government and officers of the armed forces presented before the Annual Congress on Medical Education and Licensure in February 1943 various aspects of medical education and the war.

The Army and Navy programs do not make provision for the training of physicians for civilian practice. However, it is understood that these programs will not involve the complete facilities of all the medical schools of the country and that a certain number of women and physically disqualified men may undertake the study of medicine as civilians and on their own financial resources.

SHORTAGE OF INTERNS AND RESIDENT PHYSICIANS

The Council is acutely aware of the difficulties the hospitals of the country are encountering in connection with the shortage of interns, the curtailment in the use of second year interns and the inability to obtain residents. The shortage of interns is not entirely due to the exigencies of war. The number of available internships has exceeded the annual output of medical graduates for a number of years, but some of the resultant vacancies have been filled by second year interns. The present requirement that an internship for physically qualified graduates shall not exceed twelve months has resulted in an additional increase in the number of unfilled internships. It has been suggested that all hospitals cooperate in an effort to maintain an equitable distribution of interns by limiting their appointments to actual minimum needs. The assignment of many routine procedures to nursing and technical personnel will conserve the interns' time for essential hospital and educational needs.

The Council has recently approved the acceptance of graduates of Latin American schools as interns and residents, the responsibility for the evaluation of the credentials of each applicant to rest with the hospital involved. Similarly, graduates of European medical schools may be appointed if their qualifications are found by the hospital to be satisfactory.

Graduates of medical schools in the United States who are not eligible for military service are not officially restricted as to the length of internship. Yet they are urged to complete their training as early as possible so as to be available for essential civilian needs.

In regard to residents, the Procurement and Assignment Service in February 1943 stated, "Interns who have already had a year of hospital service must be considered as residents for the duration of the war. Although the Army and Navy appreciate the importance of graduate training in the various specialties of medical practice, they do not feel that they can at the present time defer calling interns to active duty in order that they may continue specialization in civilian hospitals. Therefore the only justification for the continuation of residencies and fellowships during the war is that they are essential for the provision of adequate medical care for the hospital patients or for the clinical training of medical stu-

dents." In 1942 the Procurement and Assignment Service stated that in general the essential number of residencies should be less than 50 per cent of the number that hospitals had before the war and for 1943 this number must be reduced still more.

When residency vacancies exist it has been recommended that they be filled from the following groups in order: (1) women physicians, (2) physicians ineligible for military service, (3) qualified graduates of foreign medical schools.

The Procurement and Assignment Service suggests that no request for deferment of interns who hold commissions in the Army or Navy should be made until the possibilities of filling minimum essential residencies from the aforementioned groups have been exhausted. However, it is essential that a sufficiently adequate and competent group of residents be made available for the clinical teaching services of the medical schools.

During the past year the Council, at the request of the Procurement and Assignment Service, made a survey of the hospitals of the country in an effort to secure the names, military status and addresses of all interns and residents who completed their hospital service in 1942.

The Council has appointed a committee to confer with representatives of the American Hospital Association and the Association of American Medical Colleges in regard to the many perplexing problems relating to hospital internships and residencies.

POSTWAR GRADUATE EDUCATION

To help the expected demand for graduate training by large numbers of physicians on the cessation of hostilities, the Council is planning to make a survey of all potential and available facilities for graduate training in connection with hospitals, undergraduate and graduate medical schools, clinics, departments of health and other agencies interested in graduate or postgraduate education.

INTER-AMERICAN RELATIONS

The Council has endeavored to cooperate in the field of inter-American relationships in graduate medical education. A copy of the Educational Number of *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* in which are listed all the approved internships and residencies in the United States was sent to each of the South American schools in November 1942. The Council will offer no objection to any hospital in the United States accepting a graduate of a South American school as an intern or resident provided the responsibility for evaluating the previous training of the applicant is assumed by the hospital. An attempt is being made to get more definite information with regard to the standards of medical education in the South American schools. The Council has never been in a position to inspect any medical school outside the continental limits of the United States and has therefore not considered it justifiable to attempt to evaluate them in any way. It may be that there may develop opportunities for the Council to be of service to the South American schools beyond that indicated.

COOPERATION WITH OTHER AGENCIES

In February 1942 the Executive Council of the Association of American Medical Colleges, meeting with the Council on Medical Education and Hospitals and the Board of Trustees of the American Medical Association, approved the establishment of a liaison committee to consider matters of mutual interest. This committee was given official status by the Association of American Medical Colleges at its meeting Oct. 26-28, 1942. The first official meeting of this liaison committee was held on Feb. 13, 1943 and various matters of mutual interest were discussed and recommendations made. It is believed that the functioning of this committee will prove to be of distinct advantage to medical education.

A joint meeting of the Council on Medical Education and Hospitals and the Advisory Board for Medical Specialties was held on Feb. 14, 1943. The topics discussed included specialty credit for army service and postwar graduate training for large numbers of physicians.

MEDICAL SCHOOLS

As of March 1, 1943 sixty-six four year medical schools are named on the approved list of medical schools maintained by the Council on Medical Education and Hospitals. Two of these institutions are in a probationary status. Approval of one school was restored during the year. Rush Medical College, which offered clinical courses only, discontinued undergraduate teaching in June 1942.

Ten schools of the basic medical sciences are included on the approved list, two of them on probation. One of the schools of basic medical sciences has practically completed its development into a complete medical school and two others are initiating similar developments. One of these the University of Utah School of Medicine, is offering junior work beginning in March 1943. Still another school of the basic medical sciences is planning to establish a four year program in affiliation with medical schools outside the state.

The secretary, accompanied by a representative of the Association of American Medical Colleges, visited eight medical schools during 1942.

HOSPITALS AND TECHNICAL SCHOOLS

A summary of the Council's activities relating to hospitals and technical schools for the year ended Feb 28, 1943, including hospital registration, hospitals approved for intern training, for residencies and fellowships in the specialties, as well as the status of technical schools, follows:

Hospital Register

Hospitals registered March 1 1942	6 358
Registered during the year	155
Closed or transferred to unclassified file	168
Hospitals registered March 1, 1943	6 345

Approved Internships

Hospitals approved March 1 1942	732
Approved during year	27
Removed from approved list	16
Hospitals approved, March 1 1943	743

Approved Residencies and Fellowships

Hospitals approved March 1 1942	632
Approved during year (residencies)	43
Removed from approved list (residencies)	9
Hospitals approved March 1 1943	666

TECHNICAL SCHOOLS

Approved Schools for Clinical Laboratory Technicians

Approved schools March 1 1942	174
Approved during year	56
Removed from approved list	3
Approved schools March 1 1943	227

Approved Schools for Physical Therapy Technicians

Approved schools March 1 1942	16
Approved during year	7
Removed from approved list	1
Approved schools March 1 1943	22

Approved Schools of Occupational Therapy

Approved schools March 1 1942	6
Approved during year	1
Removed from approved list	0
Approved schools, March 1 1943	7

CENSUS OF HOSPITALS

The Twenty-Second Annual Census of Hospitals covered the year 1942 and was reported in the Hospital Number of THE

JOURNAL, March 27, 1943. Some significant points brought out in this survey are mentioned in the following paragraphs:

Registered hospitals number 6,345, 13 fewer than in 1941. The capacity of these hospitals was 1,383,827 beds, or 59,446 more than in 1941. The total number of patients admitted, not counting newborn infants, was 12,545,610, equal to nearly 10 per cent of the entire population of the United States. Information was obtained from more than 99 per cent of the hospitals including 1,038 hospitals approved for internships and/or residencies in specialties. This group of approved hospitals offers 7,959 internships and 6,363 residencies, assistant residencies and fellowships. At the time of reporting in January 1943 they had a total of 5,567 interns and 4,452 residents on duty.

In this census the first complete survey of blood banks and plasma banks in hospitals was made, and 610 hospitals reported that they had blood banks, 1,741 plasma banks and 546 both blood and plasma banks, while 2,457 have such facilities readily available.

Births in hospitals in 1942 totaled 1,670,599. This evidently is well above one half of all births in the entire country. The proportion of births occurring in hospitals varies from 158 per cent in Mississippi to 922 per cent in New Jersey.

Statistics by states were also published to show the percentage of the population hospitalized, the number of operations, the percentage of patients operated on, the number of deaths and the number and percentage of necropsies.

Data were also included regarding administrative nursing and technical personnel in hospitals. In the nursing schools 98,166 students were enrolled as compared with 93,977 in 1941.

The Hospital Number supplied detailed information with regard to technical schools approved by the Council. Those include 227 schools for the training of laboratory technicians, 22 schools for physical therapy technicians and 7 schools of occupational therapy. Studies of mutual training courses for medical record librarians were also reported.

CONTINUATION COURSES

Opportunities for continuation courses for practicing physicians offered in quarterly periods were published in THE JOURNAL of July 25, Oct 17 and Dec 26, 1942 and March 20, 1943.

ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR CLINICAL
LABORATORY TECHNICIANS

The Council recommends that the Essentials of an Acceptable School for Clinical Laboratory Technicians Section III Faculty, paragraph 2, first sentence, be modified to read: "In laboratory practice the enrollment should not exceed two students to each member of the teaching staff. The Council desires ratification by the House of Delegates."

ESSENTIALS OF AN ACCEPTABLE SCHOOL FOR PHYSICAL
THERAPY TECHNICIANS

A subcommittee of the Council is now drafting a revision of the Essentials of an Acceptable School for Physical Therapy Technicians, which will be presented to the House of Delegates at its forthcoming session for ratification.

COOPERATION WITH COMMITTEE ON AMERICAN
HEALTH RESORTS

At the meeting of the Council on Feb 15, 1942 the Committee on American Health Resorts submitted a request that the Council on Medical Education and Hospitals aid in the study of health resorts by having its staff of inspectors visit spas seeking recognition by the committee. After a preliminary survey of two institutions to determine the feasibility of such a program, the Council has proceeded with the inspection of health resorts. Five institutions have thus far been visited and others will be visited as far as the present personnel of the Council will permit.

SCHOOLS FOR TRAINING OF MEDICAL RECORD LIBRARIANS

In June 1942 a resolution was introduced to the House of Delegates requesting that the American Medical Association inspect and approve or disapprove present and future schools for the training of medical record librarians. This matter

was referred to the Board of Trustees, which subsequently voted that the Council on Medical Education and Hospitals be asked to supervise the inspection of such schools. In accordance with this request the Council has completed a survey of ten medical record librarians schools. A subcommittee of the Council is preparing minimum Essentials of an Acceptable School for Medical Record Librarians, which the Council hopes to present to the House of Delegates for ratification at its next meeting.

COUNCIL PUBLICATIONS

Major publications during 1942 and thus far in the present year include

Hospital Service in the United States
State Board Number of THE JOURNAL
Medical Education in the United States and Canada
Compilation of Papers Read at the Annual Congress on Medical Education and Licensure
Choice of a Medical School
Approved Colleges of Arts and Sciences
Schools for Clinical Laboratory Technicians
Schools for Physical Therapy Technicians
Schools of Occupational Therapy

SECRETARY OF THE COUNCIL

The Council is pleased to announce the appointment of Dr. Victor E. Johnson, Dean of Students at the University of Chicago School of Medicine, as Secretary of the Council on Medical Education and Hospitals. Dr. Johnson will assume the responsibilities of the secretariate beginning July 1, 1943.

IN APPRECIATION

The Council has met with government and military officials a number of times during the year and wishes to express its appreciation for their recognition of the importance of maintaining adequate educational standards in these difficult times and also for their readiness in supplying data for the Educational Number of THE JOURNAL and for their personal presentations at the Annual Congress on Medical Education and Licensure.

The Council is also deeply grateful to the executive officers of medical schools, hospitals and licensing boards and technical schools for their cordial cooperation in supplying the various data needed for the annual compilation of statistics and for the maintenance of its records.

Finally, the Council desires to express its appreciation to the officers and trustees of the American Medical Association for their whole hearted cooperation and assistance in the conduct of the various activities of the past year.

REPORT OF THE COUNCIL ON SCIENTIFIC ASSEMBLY

To the Members of the House of Delegates of the American Medical Association

CANCELLATION OF 1943 ANNUAL SESSION

Conditions incident to the prosecution of the war effort of the nation made it necessary to cancel the annual session of the Association, which was scheduled to be held in San Francisco in 1943. For that reason, no meetings of the Scientific Assembly will be held during the current year.

The usual meetings of the Council on Scientific Assembly were held during the last annual session in Atlantic City, and the regular annual meeting was held in Chicago on Dec. 4, 1942. At the same time the annual Conference of Section Secretaries with the Council was held, and plans were made whereby the officers of the sections would cooperate with the Editorial Department in maintaining the quality and quantity of scientific

material for publication in THE JOURNAL. The large number of scientific papers presented at each annual session of the Scientific Assembly and thereby made available for publication in THE JOURNAL will not be available for publication in 1943 or in the first part of the succeeding year. The secretaries and other officers of the scientific sections have generously and enthusiastically offered their active cooperation in a plan designed to procure suitable material of timely interest.

CONTINUANCE OF SERVICE OF SECTION OFFICERS

As there will be no meetings of the scientific sections in 1943 the elected officers of these sections will continue to serve in their present capacities until their successors are elected and installed, in accordance with the provisions of the Constitution and By-Laws.

SESSION FOR GENERAL PRACTITIONERS

In accordance with the action of the House of Delegates at the annual session in 1941, two sessions for general practitioners were held in the Section on Miscellaneous Topics at the Atlantic City session. These sessions were well attended and the programs presented were well received. It is the purpose of the Council on Scientific Assembly to arrange for similar sessions for general practitioners to be held in the Section on Miscellaneous Topics at the next annual session of the Association.

WARTIME GRADUATE MEDICAL MEETINGS

In compliance with recommendations offered by the Council on Scientific Assembly to the Board of Trustees, provision has been made for wartime graduate medical meetings to be held at concentration centers where large numbers of medical personnel are on active duty with the military forces. These courses are to be offered through a joint committee representing the American Medical Association, the American College of Physicians and the American College of Surgeons. The Surgeon Generals of the U. S. Army, U. S. Navy and U. S. Public Health Service have cordially endorsed this undertaking and have graciously offered active cooperation toward its success.

The joint committee is composed of Dr. Edward L. Bortz of Philadelphia, Chairman, a member of the Council on Scientific Assembly, Dr. William B. Breed of Boston and Dr. Alfred Blalock of Baltimore. The committee has organized a Board of National Consultants composed of prominent physicians who will cooperate in the preparation of teaching schedules and who will also cooperate with regional committees in working out local programs and in securing contributors. The programs will be submitted to the Surgeon Generals of the Army, Navy and Public Health Service and the commanding officers of the various army corps commands and naval districts. Section committees, representing twenty-four sections of the country, will be responsible for arranging for the presentation of the teaching programs, will aid in the selection of teachers within their respective territories and will be requested to attend to other important details.

Physicians residing in communities near military concentration centers will be quite at liberty to attend these Wartime Graduate Medical Meetings.

IN APPRECIATION

The Council on Scientific Assembly desires to express its appreciation of the splendid service rendered by the officers of the scientific sections and to extend its thanks to Fellows of the Association and invited guests who contributed to the scientific programs that were offered at the last annual session of the Association.

OFFICIAL NOTES

DOCTORS AT WAR

Radio broadcasts of Doctors at War by the American Medical Association in cooperation with the National Broadcasting Company and the Medical Department of the United States Army and the United States Navy are on the air each Saturday at 5 p m Eastern War Time (4 p m Central War Time, 3 p m Mountain War Time, 2 p m Pacific War Time). An exception is the Chicago area, where the broadcasts are heard by transcription at 10 30 p m Saturdays over Station WMAQ. Unless otherwise indicated each program is summarized by Dr W W Bauer, Director, Bureau of Health Education.

The titles and guest speakers for the next four programs are as follows:

- May 1 'Jungle Death'
Speaker: Brig Gen C C Hillman, Chief of the Professional Services Office of the Surgeon General, United States Army
- May 8 'Drugs March to War'
Speaker: Dr Austin E Smith, Secretary, Council on Pharmacy and Chemistry
- May 15 'High Air'

May 22 'Flash Burns'
Speaker: Rear Admiral Ross T McIntire, M C, Surgeon General, United States Navy

BEFORE THE DOCTOR COMES

The American Medical Association program on Radio Station WLS (890 kilocycles) entitled "Before the Doctor Comes" will be on the air every Thursday morning at 9 45 up to and including May 27. Mrs June Merrill will interview Dr W W Bauer, Director, Bureau of Health Education, Dr Edwin P Jordan, Assistant Editor of THE JOURNAL, or Dr Austin E Smith, Secretary, Council on Pharmacy and Chemistry, on common home health problems. The titles for the next four programs are:

- April 29 'What to Do About Bleeding'
(Jordan)
- May 6 'What to Do About Foreign Bodies in the Nose, Ears, Throat or Eyes'
(Smith)
- May 13 'Growing Pains'
(Bauer)
- May 20 'Nervous Habits'
(Bauer)

MEDICAL LEGISLATION

MEDICAL BILLS IN CONGRESS

Changes in Status—The President has signed the Sparkman bill, H R 1857, providing that during the present war and for six months thereafter there shall be included in the Medical Departments of the Army and Navy such licensed female physicians and surgeons as the Secretary of War and the Secretary of the Navy may consider necessary. Those appointed will be commissioned in the Army of the United States or the Naval Reserve and will receive the same pay and allowances and be entitled to the same rights, privileges and benefits as members of the Officers' Reserve Corps of the Army and the Naval Reserve of the Navy with the same grade and length of service. H Res 189 has been favorably reported by the House Committee on Printing, to authorize the printing as a document of a revised edition of House Document No 151, Seventy-Seventh Congress, entitled "A Digest of State Laws Affecting the Hard of Hearing and the Deaf," compiled by the State Law Index Section of the Legislative Reference Service of the Library of Congress.

Bill Introduced—S 1007, introduced by Senator Hill, Alabama, provides that during the present emergency and for six months thereafter the Chief of the Dental Division, Surgeon General's Office, Army of the United States, shall have the rank, pay and allowances of major general and that there shall be officers of the Dental Corps promoted to the grade of brigadier general at the ratio of one for each six officers of the Medical Corps promoted to like grade.

DISTRICT OF COLUMBIA

Bills Introduced—H R 2464, introduced, by request, by Representative Randolph, West Virginia, proposes to amend existing law relating to the registration of births in the District of Columbia. H R 2465, introduced, by request, by Representative Randolph, West Virginia, proposes to redefine the powers and duties of the Board of Public Welfare of the District of Columbia and to establish a Department of Public Welfare.

STATE MEDICAL LEGISLATION

California

Bills Introduced—A 573, to amend the business and professions code, proposes to prohibit the board of osteopathic examiners from issuing any drugless practitioners' certificates and to authorize persons holding drugless practitioners' certificates to continue to practice under the authorization of such certificates and to renew them from time to time. A 667, to amend

the health and safety code, proposes, among other things, to add thyroid to the list of drugs which may be sold only on the written prescription of a member of the medical, dental or veterinary profession who is licensed by law to administer such drug and to prohibit the sale of any drugs, medicines or other substances intended to be used for the cure or treatment of gonorrhea, syphilis, chancroid, lymphogranuloma venereum or granuloma inguinale except on written order of a duly licensed physician.

Connecticut

Bill Introduced—H 1265 proposes to make both husband and wife liable for reasonable and necessary services for hospital expenses rendered the husband or wife or a minor child living with the parents.

Florida

Bill Introduced—H 10, to amend the naturopathic practice act proposes, among other things, (1) to increase the course of study in an approved naturopathic school from three to four years, eliminating the prior requirement that no two of such courses may be given in the same year, (2) to require naturopaths, at the time of the annual renewal of their license to present satisfactory evidence that they have attended the two day educational program conducted by the Florida Naturopathic Physicians Association, Inc, or its equivalent, (3) to provide for the termination of a license to practice naturopathy in the event that the holder thereof fails to renew said license annually and (4) to require naturopaths to register their licenses with the state board of health.

Maine

Bill Enacted—H 1352 was approved, April 9. To amend the law relating to infectious and communicable diseases, it requires every physician, within forty-eight hours of the time the fact comes to his knowledge, to report in writing to the state bureau of health any person known by said physician to have any of the following infectious and communicable diseases: syphilis, gonorrhea, chancroid and lymphogranuloma venereum. The law also authorizes the state bureau of health to detain and examine any person believed to be infected with one of the aforementioned diseases and so conducting himself as to expose others to the dangers thereof.

Massachusetts

Bill Introduced—H 79, to authorize the inspection of colleges, universities and medical schools, was amended in the house to authorize also an inspection of the premedical collegiate work at colleges and universities and to provide that such inspection shall be made not more than once in every four years.

Missouri

Bill Introduced—S 112, to amend the law relating to narcotic drugs, proposes to fix the annual license fee for physicians, dentists, veterinarians, surgeons and other practitioners lawfully entitled to administer such drugs in the course of their professional practice at \$1 per annum.

New Jersey

Bill Enacted—A 94 has become chapter 74 of the Laws of 1943. To amend the medical practice act, it exempts therefrom persons taking charge temporarily on written permission of the board, of the practice of a lawfully qualified physician in the state and sets forth conditions under which the board may grant such temporary permission.

Oklahoma

Bills Enacted—H 37 was approved, March 18. It authorizes state and local health officers to examine arrested persons to determine whether or not they are infected with a venereal disease, to detain such persons until the results of the examination are known and, if found infected, to quarantine such persons for the purpose of treatment. H 249 was approved, April 12. It creates a special indemnity fund out of which physically impaired employees would receive compensation for additional disability occurring in the course of employment. Physically impaired person is defined as a person who has suffered the loss of the sight of one eye, the loss by amputation of some member of his body, or the loss of the use or partial loss of the use, of a specific member such as is obvious and apparent from observation or examination by an ordinary layman, that is, a person who is not skilled in the medical profession.

Pennsylvania

Bill Enacted—H 504 has become act No 24 of the Acts of 1943. It exempts physicians in the armed forces or merchant marine from being required to renew their licenses during the term of such service and authorizes such persons to apply for renewal thereof at any time within one year after their discharge.

Rhode Island

Bills Introduced—S 177 to amend the law relating to cash sickness insurance, proposes to exempt from the provisions thereof employees who adhere to the teachings of any church, sect or denomination and depend for healing on prayer or spiritual means in the practice of religion. H 668 proposes an appropriation to be expended for the hospitalization of wives and children of men in the armed services below the grade of commissioned officer who are unable to pay for such hospital care. H 841 proposes to require an examination of the feet of all school children at least once each year by a licensed chiropodist, who shall report all defects which, if neglected, might unfavorably influence the child's health or physical efficiency.

South Carolina

Bills Introduced—S 448 and S 518 propose a resolution looking to the appointment of a committee to examine into the advisability of establishing a cancer clinic and hospital in the state. H 500, to amend the chiropractic practice act, proposes that licentiates be graduates of a recognized school or college of chiropractic and have received a minimum of four years, totaling thirty-six hundred hours, training in such school or college.

South Dakota

Bills Enacted—S 129 was approved, March 8. It exempts from the basic science act persons engaged in the practice of hydrotherapy. H 32 was approved, February 9. It provides that osteopaths be required to renew their certificates to practice annually and to submit evidence, at the time of such renewal, of attendance of at least two days at the annual educational program conducted by the South Dakota state osteopathic association during the preceding year.

Texas

Bill Introduced—H 651 proposes to authorize a county to erect, equip and operate a hospital for the care and treatment of the sick, infirm or injured.

Utah

Bill Enacted—H 49 was approved, March 16. It provides that persons who have entered the military service of the United States during the present war emergency shall be relieved from renewing their licenses annually and from paying an annual renewal fee for such licenses during the period of such service and for six months after its termination.

Vermont

Bills Enacted—H 50 was approved, March 18. It amends the medical practice act by repealing the section setting forth the requirements for admission to practice and substituting therefor an authorization that the board shall make rules and regulations covering requirements for admission to practice medicine and surgery. H 131 was approved, March 16. It amends the osteopathic practice act by authorizing a recognized school of osteopathy to give a course of thirty-six months rather than a four year course of at least five months in each year. H 151 was approved, March 22. It amends the premarital examination law by authorizing the execution of the required certificate by an osteopath and by a member of the medical corps of the army, navy or public health service as well as by a person licensed to practice medicine and surgery.

Washington

Bills Enacted—S 76 has become chapter 108 of the Laws of 1943. It exempts members of the armed forces from being required to continue in full force and effect their license to practice a profession in the state and provides that the renewal of such license may be made within six months after an honorable discharge. S 218 has become chapter 75 of the Laws of 1943. It authorizes the director of licenses, during the present emergency, to grant temporary certificates to practice medicine and surgery to physicians duly licensed and qualified to practice under the laws of some other state and proposes that such temporary license shall be valid from the date of issuance until the next regular examination given by the board of examiners. S 301 has become chapter 240 of the Laws of 1943. To amend the law relating to dentistry it provides that every diagnosis and examination of the normal and abnormal structures, parts or functions of the human teeth the alveolar process, maxilla, mandible or soft tissue adjacent thereto be declared to be the practice of dentistry but provides that this act shall not be construed as preventing a regularly licensed physician and surgeon from making any such diagnosis interpretation or explanation. H 41 has become chapter 197 of the Laws of 1943. It authorizes the establishment of emergency health and sanitation areas and sets forth certain regulations applicable to the state board of health in connection therewith. H 127 has become chapter 214 of the Laws of 1943. It makes it unlawful for any person to maintain or operate a maternity home without a license and defines maternity home as any place where women go to be delivered of children.

West Virginia

Bills Enacted—S 30 was passed over the governor's veto, March 13. It authorizes state boards of examination or registration to remit all annual license or registration fees required to be paid by any licensee during the time such licensee is serving with the armed forces of the United States and to retain the name of such licensee in good standing during said period. S 36 was approved, March 19. It provides for the creation of a division of cancer control in the state department of health to administer provisions relating to the diagnosis, treatment and care of persons suffering from cancer, including the conduct of an educational program the establishment of cancer clinics in general hospitals throughout the state and the furnishing of tissue diagnostic service to all patients. S 85 was approved, March 9. It authorizes the board of governors of the West Virginia University to establish a four year medical course to be given either at the university or in part at other universities and medical colleges outside the state. S 141 was approved, March 19. It authorizes the inclusion within an accident and health insurance policy of indemnity for expenses for hospitalization, medical and surgical examination or treatment, nursing care or ambulance transportation of the policyholder, his spouse or his children. H 120 became law, without the governor's

approval, March 18. It authorizes the formation of a nonprofit, nonstock hospital service corporation for the purpose of furnishing medical service and hospital service to persons who become subscribers with such corporation. Medical service shall consist of medical and surgical care as specified in the subscriber contract and must be provided by duly licensed doctors of medicine. Hospital service shall consist of hospital care as specified in the subscriber contract and must be provided by a hospital which is maintained by a corporation organized for hospital services under the law of the state or such other hospitals as shall be designated by the state department of health and hospitals of other states subject to the supervision of such other state or convalescent care provided for by a convalescent institution. The law is to expire Feb. 28, 1945 unless sooner repealed. H. 230 was approved, March 18. It provides, among other things, that every physician who examines or treats a person having syphilis, gonorrhea or chancroid shall instruct such person in measures for preventing the spread of the disease and inform such person of the necessity of taking treatment until cured. If the person fails to report for treatment, the physician must make a report of such fact to the local health officer.

Wisconsin

Bills Introduced—S. 253 and S. 279, to amend the law relating to hospital service corporations, would authorize such corporations to provide hospital service in other than participating hospitals to subscribers and their dependents. Furthermore, the

subscriber would have the right to choose the particular participating hospital or service hospital in which he wished to be treated. S. 259 proposes to amend the premarital examination law so as to include females as well as males. S. 276, to amend the law relating to hospital service corporations, proposes to authorize such corporations to enter into contracts undertaking to provide for sickness or surgical services and to act as agents in enrolling persons or groups for such sickness or surgical services and indemnity benefits therefor. A. 140, proposing the creation of a bureau of criminal investigation would, among other things, require every physician, surgeon or other person authorized to engage in the practice of healing, whether licensed or not, to report to the proper police authorities all bullet wounds, gunshot wounds, powder burns or any other injury arising from or caused by the discharge of a gun, pistol or any other firearm, which wound he is called on to treat, dress or bandage. A. 380 proposes that any physician, surgeon or osteopath in charge of the medical treatment or hospitalization of any minor who has suffered any serious cranial or spinal injury, hemorrhage, laceration or concussion within fifteen days from the date of an injury shall make a report thereof to the local and state boards of health and the district school board. A. 601, to amend the workmen's compensation act proposes to authorize injured employees to select chiropractors or osteopaths not on the employer's physician panel and to make the employer liable for reasonable expenses incurred in treatment by such practitioners.

WOMAN'S AUXILIARY

Arkansas

The Woman's Auxiliary to the Pulaski County Medical Society met February 17, at the home of Mrs. Pat Murphy. Mrs. Homer Higgins, chairman of the sewing committee, reported that in the past month her committee had put in four hundred and thirteen hours at the Camp Robinson Day Room furnished by the auxiliary and had in that time altered two hundred and sixty-seven garments for the men. Mrs. Charles A. Henry enlisted the services of enough volunteers to man for one week a grocery store to assist the grocer in acquainting customers with the food rationing plan. Mrs. R. T. Smith introduced Ensign Corabel Hamilton, who addressed the meeting on the activities of the Waves enlistment program now in progress in Arkansas.

Florida

A meeting of the Woman's Auxiliary to the Duval County Medical Society was held at the home of Mrs. Victor Hughes on January 14. Mrs. S. R. Norris introduced Lieut. Linda V. Barnes of New York who spoke on "The Life of a Ware." The defense chairman, Mrs. Charles Henley and Mrs. George Richardson, reported on the Halloween party given for the service men in October. Auxiliary members sold \$50.65 worth of tuberculosis seals at the Roosevelt Hotel booth in December and assisted with the blood bank to the amount of \$335.22. Mrs. F. W. Krueger, state president, talked on the objectives of the national auxiliary.

New York

Mrs. James F. Roohan has been reelected president of the Saratoga County medical society's auxiliary. Dr. William H. Ordway thanked the group for serving coffee and sandwiches to blood donors. Sewing is to be started for the hospital. Mrs. H. Dunham Hunt, who has taken over the work, has asked for more blankets to be used in the air raid shelters. The names of the owners will be attached to the blankets so that they can be returned later on. A gift of \$4.24 was received from the school children of Mechanicville, grade 8A3, for the air raid shelter equipment. The auxiliary is outfitting these shelters.

The second district branch meeting was held in Garden City, with the Suffolk County auxiliary as hostess. Mrs. J. Emerson

Noll, auxiliary state president, was guest of honor. Members from Kings, Queens and Nassau were present. Dr. George W. Cottis, president of the state medical society, spoke at the luncheon. Dr. Joseph Lawrence spoke on legislation. The general chairman was Mrs. George P. Bergmann, president of the Suffolk County auxiliary. A needlepoint footstool was given to the auxiliary on which \$100 was realized for charity.

Pennsylvania

Sixty members of the Berks County Medical Society and its women's auxiliary met at the Wissinoming Club Reading for an evening of fellowship and music. Dr. Wellington A. Lebkucker, president of the medical society, and Mrs. Chester K. Kistler, vice president of the auxiliary, received the guests. A program of music was presented by Dr. Charles A. Hoff and three artists from Northampton. Mrs. Jessie Foster Rice of Pittsburgh, granddaughter of Stephen C. Foster, was introduced and I. Bennett Nolin, Reading lecturer and traveler spoke on "Reminiscences of a Historical Town."

The Chester County auxiliary met at a covered dish luncheon at the home of Mrs. Oscar J. Klevan, West Chester. Mrs. C. Remond Noyes spoke on "What Kind of a Peace Do We Want?"

Texas

The Bexar County auxiliary observed its Army Day program recently at the Medical Library Building, San Antonio. Col. George E. Beach, commanding officer of Brooke General Hospital, talked about Army hospitals. The Gray Ladies of the Red Cross hospital and recreation corps were honor guests. Members of the auxiliary brought gifts for the Gray Ladies to use as prizes in games which they conduct for soldiers in hospitals. Mrs. G. P. Robertson, a member of the Gray Ladies Corps, spoke briefly of the activities of the corps. The program was presented under the direction of Mrs. I. T. Cutter, chairman of the Gray Ladies Corps.

Washington

At the annual meeting of the executive board a resolution was adopted making Daisy Searles Mosman, of Seattle, an Honorary Life Member of the Woman's Auxiliary to Washington State Medical Association. Mrs. Mosman formerly was President of the Woman's Auxiliary to the American Medical Association.

Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST, SUCH AS RELATE TO SOCIETY ACTIVITIES, NEW HOSPITALS, EDUCATION AND PUBLIC HEALTH.)

CALIFORNIA

Annual Heart Meeting—The California Heart Association will hold its annual meeting at the Biltmore Hotel, Los Angeles, May 1, with Lieut. Comdr. Harold Rosenblum, M. C. U. S. Naval Reserve, Oakland, presiding. Among the speakers will be Dr. Wilbur A. Beckett, Los Angeles, on "Acute Gout Caused by Aminophyllin"; Dr. Samuel F. McClelland, San Diego, "The Incidence of Acute Rheumatic Fever in Southwestern United States"; Lieut. Comdr. Richard F. McLaughlin, M. C. U. S. Naval Reserve, Oakland, "Rheumatic Infection in a Pleural Area"; and Dr. Jacob S. Kravitz and Capt. Meyer Friedman, M. C. U. S. Army, San Francisco, "Hypertension in Only One of Identical Twins". Guest speakers will be Drs. George Blumer, New Haven, Conn., and Alvin G. Ford, Pasadena.

CONNECTICUT

State Medical Meeting—The one hundred and fifty-first annual meeting of the Connecticut State Medical Society will be held at the New Haven Lawn Club, May 25-27, under the presidency of Dr. Roy L. Lerk, Middletown. Among the speakers will be:

- Dr. Thomas Duckett Jones, Boston, Rheumatic Fever and Rheumatic Heart Disease
- Dr. George H. Gelman, Wilmington, Del., Medicine in Wartime Industry
- Dr. James C. McCann, Worcester, Mass., Prepaid Medical Service Plans
- Dr. James E. Paulin, Atlanta, Ga., President Elect of the American Medical Association, The Contribution of the Medical Profession in the Present War Effort
- Dr. Joseph Stokes, Jr., Philadelphia, Practical Applications of Air Sterilization
- Dr. Marion E. Kenworthy, New York, The Dynamic Use of Psychiatric Principles in the Present Emergency
- Dr. Walter W. Williams, Springfield, Mass., Sterility
- Dr. John D. Currence, New York, Arthritic and Rheumatic Conditions Amenable to Physical Therapy
- Dr. Willard C. Rappaport, New York, Medical Education in Wartime
- Dr. H. Jackson Davis, Albany, N. Y., Public Medical Care for Indigents
- Dr. Reginald H. Smithwick, Boston, The Surgical Treatment of Hypertensive Disease
- Brig. Gen. David A. Walker, Grant, M. C. U. S. Army, Medical Services to the Air Forces—U. S. A.
- Comdr. Bartholomew W. Hogan, M. C. U. S. Navy, Navy Medical Corps in Wartime
- Dr. Moses H. Lurie, Boston, Deafness in the War and in the War Industries
- Dr. Ramon Castroviejo, New York, Comments on Ophthalmic Surgery
- Major Alliston I. Fogg, M. C. Army of the United States, Orthopedic Regulations for Induction
- Dr. Felix G. Fleischer, Greenfield, Mass., Roentgenologic Aspects of Atypical Pneumonias and Related Conditions
- Dr. Alan R. Moritz, Boston, Special Evidentiary Objectives of Medical Legal Autopsies
- Dr. Clay Ray Murray, New York, Surgical Treatment of the Hand in the General Practitioner's Office

At a meeting of the house of delegates on the first day the program will be devoted to a round table discussion of "Prepaid Medical Service". Other groups meeting at this time will be the Connecticut Hospital Association, American Association of Medical Social Workers, Connecticut Occupational Therapy Society, the Society of Medical Record Librarians and the Women's Medical Society.

ILLINOIS

Conference on Industrial Health—The division of industrial hygiene of the state department of public health sponsored a conference in La Salle, April 8. Among the speakers were:

- Dr. Milton H. Kronenberg, Chicago, Objectives of the Conference
- Dr. Paul A. Brehm, Madison, Wis., Absenteeism in Industry—Its Causes and Control
- Dr. Oscar A. Sander, Milwaukee, Tuberculosis in Industry
- Dr. Edward C. Holmblad, Aurora, How the Small Plant Can Conduct a Health Program
- Mr. Harry Guilbert, director, bureau of safety and compensation, Pullman Company, Chicago, A New Era for Health and Safety in Industry
- Dr. Chauncey C. Maher, Chicago, What About the Health of the Executive? Is His Heart Next?

Dr. John L. Rock, Oglesby, chairman of the industrial health committee of the La Salle County Medical Society, presided at the morning session and Dr. Orie C. Yoder, Peru, president of the society, at the evening session.

CHICAGO

Second Cancer Forum—The Chicago Cancer Committee Inc. will hold the second of its series of forums for the public on cancer in the John B. Murphy Memorial Auditorium at the American College of Surgeons, April 27. "Facts About Cancer" will be the theme of the forum with the Rev. Harrison Ray Anderson, D.D., pastor of the Fourth Presbyterian Church, acting as moderator. Dr. Ludvig Hektoen, chairman of the cancer committee, will present the introduction. The speakers will include:

- Dr. Bowman C. Crowell, The Course of Cancer
- Dr. Josiah J. Moore, The Causes of Cancer
- Dr. Herbert E. Schmitz, The Diagnosis of Cancer
- Dr. John A. Wolfer, The Curability of Cancer
- Dr. Frederick W. Merrifield, What the Patient Can Do About It

Annual Public Health Meeting—The third annual public health conference of the Illinois Public Health Association will be held at the Hotel La Salle, May 14-15, with W. P. Shahan, Springfield, president, acting as chairman. One session will be devoted to war trends in public health consideration to be given to maternal and child health day care for war workers' children, nutrition in the school, high school physical fitness, industrial hygiene and civilian venereal disease control. Dr. Roland R. Cross, director of the state department of public health, Springfield, will be toastmaster at the banquet with Dr. Herman A. Bundesen, Chicago, Gov. Dwight H. Green (tentative) and Dr. Robert Hughes Parry, medical officer of health for the city and port of Bristol and professor of preventive medicine at the University of Bristol, England, who will discuss "Shelter Life in the Blitzed City". Among the speakers at the administrative session will be Lieut. Col. E. Vann Hartlett, M. C., U. S. Army, on "Public Health Needs Revealed by Selective Service Examinations"; Dr. G. Foard McGinnes, St. Louis, "Administrative Responsibilities of the American Red Cross in Relation to Public Health"; and Howard J. Shaughnessy, Ph.D., Chicago, "The Plasma Distribution Program of the Illinois Department of Public Health". A technical session will be devoted to industrial sanitation and house keeping in industry, the sanitary engineer in public health during wartime, public health milk control during wartime, duration of passive protection of hyperimmune western equine encephalomyelitis serum and laboratory studies of epidemic keratoconjunctivitis.

IOWA

Public Health Meeting—The seventeenth annual session of the Iowa Public Health Association will be held, April 27-28, at the Hotel Kirkwood, Des Moines. Dr. Robert Hughes Parry, medical officer of health of the city and port of Bristol, England, will discuss "Some Wartime Health Problems". Other speakers will include Dr. Felix J. Underwood, Jackson, secretary and executive officer of the Mississippi State Board of Health, on "Public Health Today"; Dr. Walter C. Alvarez, Rochester, Minn., "Problems of Constitutionally Frail People"; Byron J. Olson, Bethesda, Md., passed assistant surgeon, U. S. Public Health Service, "Report of the Field Study and Lung Calcification in Iowa"; and H. A. Whittaker, B.A., Minneapolis, "Some Problems in Sanitation".

Center to Process Plasma—The Serum-Plasma Center of the state department of health, Des Moines, has announced its readiness to cooperate with participating hospitals of Iowa in the preparation of pooled plasma. The center will receive citrated blood from hospitals, prepare plasma and return the finished product to hospitals that participate in the work. The center has been cooperating in the procurement and distribution of pooled normal human plasma and serum with the Emergency Medical Service of the Office of Civilian Defense with hospitals that maintain a blood plasma bank and with organizations and groups that sponsor blood donor programs. Until further notice the actual cost to a participating hospital will be \$3.50 for each 250 cc. unit of plasma prepared from bottles of citrated blood. The purpose of the department's Serum-Plasma Center is to offer its facilities to hospitals which desire to secure at minimum cost safe, sterile plasma adequate for their needs.

MAINE

New Chairman of Procurement and Assignment—Dr. Roland L. McKay, Augusta, has been appointed state chairman for physicians in the war procurement and assignment service for physicians, dentists and veterinarians to succeed Brig. Gen. John G. Towne, M. C., U. S. Army, retired, Waterville. General Towne will continue to serve as medical adviser for the Maine Selective Service.

NEBRASKA

Changes in the Faculty at University—Dr John Hewitt Judd, associate professor of ophthalmology, has been named chairman of the department of ophthalmology at the University of Nebraska College of Medicine, Omaha. Other changes include the following promotions:

Dr Harold Gifford Jr to associate professor of ophthalmology
Dr David P. Findley to assistant professor of gynecology and obstetrics
Dr Harley E. Anderson to assistant professor of obstetrics
Dr Robert J. Stearns to associate professor in gynecology
Dr Charles P. Baker to assistant professor in pathology and bacteriology

Dr Herman F. Johnson to associate professor of orthopedics and surgery in charge of the division of fractures

NEW YORK

Rabies in a Squirrel—A cement finisher in Rockland County was recently bitten by a squirrel when he reached into a tool box. A second workman sprang to his aid and was also bitten. Subsequently laboratory examination gave evidence that the common gray squirrel was rabid and the 2 workmen were given injections of antirabic vaccine.

Postgraduate Education—On May 21 a graduate lecture on 'Sulfonamide Therapy' will be presented before the Cortland County Medical Society, Cortland, under the auspices of the state medical society and the state department of health. Dr Charles D. Post, professor emeritus of clinical medicine, Syracuse University College of Medicine, will be the lecturer. Dr Norman H. Plummer, New York, gave a similar lecture for the Putnam County Medical Society in Carmel, April 7. Dr Earle B. Mahoney, Rochester, lectured on "Plasma Therapy and Whole Blood Transfusion," April 6, under the same auspices at a joint meeting of the Onondaga County Medical Society and the Syracuse Academy of Medicine.

State Medical Meeting—The Medical Society of the State of New York will hold its annual session at the Hotel Statler, Buffalo, May 3-6, under the presidency of Dr George W. Cottis, Jamestown. Included among the out of state speakers will be:

Dr George Bachr, chief medical officer, Office of Civilian Defense, Washington, D. C. British and American Experiences in Civil Defense
Dr Maurice H. Seever, Ann Arbor, Mich. The Narcotic Properties of Carbon Dioxide
Capt Barnett A. Greene, M. C. Army of the United States. Prolonged Intravenous Pentothal Anesthesia for Military Surgery
Dr Louis Schwartz, Bethesda, Md. Occupational Acnes
Drs Joseph C. Yaskin, Helena, E. Riggs and Anthony S. Tornay, Philadelphia, and Henry Alsop Riley, New York. Bilateral Blindness Due to Lesions in Both Occipital Lobes
Dr Francis Heed Adler, Philadelphia. Gas Injuries
Dr Harry S. Gradle, Chicago. Early Recognition and Management of Glaucoma
Dr Chevalier L. Jackson, Philadelphia. Treatment of Cancer of the Larynx by Surgery and Irradiation
Dr David E. Robertson, Toronto. Use of Sulfonamides in Treatment of Acute Osteomyelitis in Children
Lydia J. Roberts, Ph.D., Chicago. Scientific Basis for Our Present Dietary Standards
Lieut. Col. Thomas T. Mackie, M. C. U. S. Army. Tropical Diseases—A Postwar Health Problem
Lieut. Col. Paul E. Russell, M. C., Army of the United States. Military Malaria Control
Lieut. Col. Claude S. Beck. The Principles Concerning the Surgical Approach to the Treatment of Angina Pectoris
Dr Joseph H. Pratt, Boston. Advances in Diagnosis and Treatment of Pancreatic Disease
Dr Robert E. Gross, Boston. Surgical Treatment of Patent Ductus Arteriosus
Raymond A. Vonderlehr, assistant surgeon general, U. S. Public Health Service, Washington, D. C. Syphilis Control at the Beginning of World War II
Lieut. Comdr. Leo A. Shifrin, M. C. U. S. Naval Reserve. Venereal Diseases—A Navy Problem
Major William Bisher, M. C. Army of the United States. Venereal Disease Control as Applied to the Army
Dr Jessie Wright, Pittsburgh. Problems in Early Physical Treatment of Poliomyelitis
Lieut. Sidney H. Licht, M. C. Army of the United States. Fever and Sulfadiazine Therapy in Refractory Gonorrhea

The program will also include symposiums on plasma, medical services in industry, carcinoma of the colon and rectum, electroshock therapy, rheumatic fever and venereal diseases with regard to the armed forces. In addition there will be a round table discussion on anesthesiology as applied to war casualties.

New York City

Committee on Cardiovascular Diseases in Industry—The New York Heart Association has formed a committee on cardiovascular diseases in industry to advise concerning the employment of persons with cardiovascular diseases. It is planned to use the facilities of the New York Heart Association, which consists of sixty-six cardiac clinics, in furthering this work. Dr Clarence E. de la Chapelle is chairman of the

committee. Other members are Drs Donald B. Armstrong of the Metropolitan Life Insurance Company, Oswald F. Hedley, surgeon of the U. S. Public Health Service, Ada Chree Reid of the Metropolitan and Cassius H. Watson of the American Telephone and Telegraph Company. It is planned to add to the committee as the need arises. Although the committee was originally formed for the purpose of dealing with cardiac problems in industry in New York, it is not intended to limit the scope of its activities to that locality.

New Merchant Marine Polyclinic—A clinic was to be opened in March for seamen sailing on Netherlands vessels, the New York *Times* reported recently. The clinic will be housed on the eighth floor of 61 Broadway, the offices of the Netherlands Shipping Committee, and will include a suite of fourteen rooms. Service will be given to about 20,000 men serving under the Dutch flag, most of whom will be passing through the Port of New York. The clinic will have facilities for diagnosis and outpatient treatment and an arrangement with New York physicians and hospitals for additional treatment when required. Dr Frans E. van der Gugen, a graduate of the University of Leyden and chief medical officer of the Netherlands Shipping Committee, will be in charge of the clinic. In a statement to the press he is reported to have said that "the service is considered a very essential one for the proper maintenance of full health standards for the men on our ships. Before the war each individual steamship company had its own medical department at its home port, but since Holland was occupied by the Germans these have, of course, been unavailable. This handicap has been further complicated by the greater incidence of psychologic problems brought on by the war, both through the men's lack of home contacts and the removal of customary means of obtaining consultation and treatment for minor ailments, causing bewilderment and mental distress."

OKLAHOMA

Personal—Robert H. Graham, Oklahoma City, has returned to his position as executive secretary of the Oklahoma State Medical Association after four months in Washington, D. C., as adviser to the Office of Procurement and Assignment. Dr James O. Asher, Oklahoma City, has been appointed medical superintendent of Western Oklahoma Charity Hospital, Clinton. Dr Willard H. Smith, Clinton, resident surgeon has been acting superintendent of the hospital since Lieut. C. E. Griffith left several months ago to enter the army. Joseph B. Goldsmith, Ph.D., associate professor of histology and embryology at the University of Oklahoma School of Medicine, Oklahoma City, has been granted a leave of absence to enter the army as first lieutenant in the sanitary corps. Ruth Alden McKinney, Ph.D., formerly of the Institute of Pathology of the Western Pennsylvania Hospital, Pittsburgh, has been appointed instructor in clinical pathology, effective March 1, to succeed Dr Erik Eschus, resigned.

PENNSYLVANIA

Survey of Industrial Plants—The bureau of industrial hygiene of the state department of health recently conducted a survey in Dauphin County of eighty-four industrial plants with 18,933 employees. The work revealed that full time physicians are employed in none of the plants but part time physicians are employed in seven plants. Full time nursing service is available in four plants and part time service is furnished in three plants. Preemployment examinations are required in sixteen plants and periodic examinations are given in sixteen plants. Ten plants are inspected regularly for hazardous conditions by the plant physician, twenty-two plants spent less than \$100 on their medical programs, other than compensation cases, during the year 1941. Forty-two of the remainder had no record of expenditure of this type. Plant medical departments handled about 6,200 cases during 1941. Twenty-four plants have a sick benefit association and thirty plants have a hospital insurance plan, twenty-three plants signified their interest in having a physician make health talks to their employees, only ten organizations stated that an industrial hygiene survey had been made in their plant during the past two years but seventy-five expressed interest in having a survey made. Ten plants have venereal disease control programs, eight plants have dispensaries and two plants have cafeterias.

Philadelphia

Shmookler Memorial Lecture—Dr Foster Kennedy, professor of clinical medicine (neurology), Cornell University Medical College, New York, will deliver the H. B. Shmookler Memorial Lecture at the Mount Sinai Hospital, May 3. His subject will be "Neuroses in Warfare."

Universities Share in Bequest—The residue of the estate of Major Henry Reed Hiltfield valued at one million dollars has been bequeathed, after the payment of \$226,000 in specific bequests to charities, to the University of Pennsylvania and to Jefferson Medical College of Philadelphia.

Drug Stores Close Earlier—Six hundred pharmacists in Philadelphia assembled in mass meeting on March 25 and unanimously agreed to adopt a schedule of earlier closing hours as submitted and endorsed by the Philadelphia Association of Retail Druggists. Effective April 15 all stores will close Monday through Friday at 10 p. m., Saturdays at 11 p. m. and Sundays, optional, 1 p. m. or at 6 p. m. for the night. Assurances were given that at all times pharmacists would respond to emergency calls, but physicians are requested to send in their evening prescriptions as early as possible or to have them delivered the following morning. According to *Philadelphia Medicine*, this movement will become national as a part of the Government's Victory Business Plan.

SOUTH DAKOTA

Dr Giedt Acting Superintendent of Health—Dr William R. Giedt, Vermillion, assistant state health officer and formerly assistant professor of pathology at the University of South Dakota School of Medical Sciences, is now acting superintendent of the state board of health. He will serve until a permanent selection is made to succeed Dr John F. D. Cook, Pierre, who died on January 27. Dr Giedt has served as director of laboratories of the state board of health.

TEXAS

Personal—Frank M. Sterd, Ph.D., formerly of the Los Angeles City Department of Health, has been appointed assistant professor of preventive medicine at the University of Texas Medical Branch, Galveston.

Change in Dates of State Meeting—The State Medical Association of Texas will meet in Fort Worth May 5-6, instead of May 3-6. The session this year will include only a meeting of the house of delegates.

Hospital News—A new 60 bed wing has been opened at Hendrick Memorial Hospital, Abilene, to meet the demand for facilities that arose when Abilene became an army town. The new wing together with an extension of the north wing of the existing building and remodeling at various points cost about \$150,000. The project was financed largely by federal funds under the Lanham Act. Local funds amounted to more than \$35,000.

Five Year Child Health Program—The William Buchanan Foundation of Texarkana has given the University of Texas Austin \$200,000 for a five year program on child health. The details were concluded at a meeting in Galveston recently between Dr Stanley J. Seeger, Texarkana, president of the foundation, and Chauncey D. Leake, Ph.D., dean of the university's medical branch, Galveston. To be launched within the near future, the program will be worked out in conjunction with the department of pediatrics of the medical branch, correlating the activities of the department and other state and national agencies. Its purpose is to afford the profession in Texas with an opportunity to maintain the latest methods in connection with the promotion of child health, especial attention to be given to the problems of the adolescent in wartime.

VIRGINIA

Rheumatic Fever Demonstration—About 150 children in Richmond and adjoining counties have been diagnosed as having rheumatic fever during a demonstration that has been conducted for the past two years by the state department of health. The children are being cared for in their own homes or hospitals and convalescent homes set up in the Richmond area. A diagnostic clinic provided with modern equipment and manned by specially qualified clinicians is operated by the state department of health in cooperation with the outpatient department of the Medical College of Virginia, Richmond. According to Dr Irl C. Riggan, Richmond, state health officer, it is expected that adequate care for these children eventually will become available throughout the state.

WASHINGTON

Personal—Robert H. Fishbach, passed assistant surgeon, U. S. Public Health Service Reserve formerly of Hawaii has been appointed director of the Lewis-Pacific Counties Public Health Department. Dr Harold B. Stout, Brewster, has been named health officer of Pateros. On February 17 the Spokane County Medical Society held a banquet in honor of Dr Erich T. Richter, Spokane, who is in his fifty-second year in the practice of medicine.

GENERAL

Wartime Hospital Conference—The executive board of the Catholic Hospital Association of the United States and Canada announces a wartime conference at the William Penn Hotel Pittsburgh, June 11-14.

Inter-State Postgraduate Meeting—The Inter-State Postgraduate Medical Association of North America will hold a four day instructional course at the Palmer House, Chicago, October 26-29, constituting the twenty-eighth annual meeting.

Gorgas Hospital Requests Scientific Material—The Gorgas Hospital, Ancon, Canal Zone, which has recently reorganized its library, is interested in securing lists of publications in the field of medicine and allied sciences and also scientific films. All communications should be directed to Major Aubrey LeV. Bradford, M. C., U. S. Army, assistant to the superintendent of the hospital.

International College of Surgeons—The fourth International Assembly of the International College of Surgeons will be held at the Waldorf Astoria Hotel in New York June 14-16 in conjunction with the eighth assembly of the United States chapter. The program will be devoted to war surgery and rehabilitation. Dr Fred H. Albee, New York, is president of the international college and Dr Thomas A. Shallow, Philadelphia of the national chapter. Additional information may be obtained from Dr Max Thorek, Chicago, the international executive secretary.

Meetings Canceled—The 1943 annual meeting of the National Tuberculosis Association has been canceled. A meeting of the board of directors has been called at the Hotel Statler, St. Louis, May 5-6, to transact necessary business. On May 5 there will also be business sessions of the council of the American Trudeau Society, the medical section of the National Tuberculosis Association, and the executive committee of the National Conference of Tuberculosis Secretaries. The same evening Dr James Burns Amberson Jr., New York, will give his presidential address, and the award of the Trudeau Medal for 1943 will be made. The American Association for the Study of Allergy has canceled its 1943 meeting.

Association for Advancement of Science—Dr Paul D. Lamson, professor of pharmacology, Vanderbilt University School of Medicine, Nashville, Tenn., was chosen vice president in charge of Section N (medical sciences) of the American Association for the Advancement of Science. The election of officers for 1943 was delayed because of the cancellation of the New York meeting. The section officers and other members were chosen by a mail ballot. In the second ballot necessary for the office of president, since no person received a majority vote, Isaiah Bowman, LL.D., president of Johns Hopkins University, Baltimore, was chosen president of the association to succeed Arthur H. Compton, LL.D., University of Chicago.

Dr Charles Huggins Receives First Mayer Award—Dr Charles B. Huggins, professor of surgery (urology) at the University of Chicago School of Medicine has been chosen as the first recipient of a \$2,000 prize given by Dr Charles L. Mayer and administered by the National Science Fund of the National Academy of Sciences. The award was offered for the most outstanding contribution made during 1942 to present day knowledge of factors affecting the growth of animal cells with particular reference to human cancer, and as a new type of prize for the advancement of fundamental scientific research administered under a new type of philanthropic foundation (*THE JOURNAL*, Dec 5, 1942 p. 1150). Specifically the award went to Dr Huggins for his studies on the human prostate, with special relation to the cancers taking origin from this gland. The prize will be presented to Dr Huggins at the annual dinner of the board of directors of the National Science Fund later this spring. A second Charles L. Mayer award of \$2,000 for an outstanding study in the same field in 1943 will be given. Entries and recommendations for consideration for the award should be in the office of the National Science Fund, 515 Madison Avenue, New York, by Jan 15, 1944. The advisory committee assisting the science fund in selection of the prize winner is interested primarily in fundamental studies on the factors influencing growth of animal cells rather than applications to any particular aspect of normal or abnormal growth.

LATIN AMERICA

Society Meetings—All the phthisiologic societies of Argentina plan to hold a reunion in Rosario in May. "The Treatment of Empyema" and "Intestinal Tuberculosis" will be discussed. The first special meeting of leprologists is to be held in Buenos Aires, May 1, in accordance with plans agreed on at a meeting of the Association of Argentinian Dermatologists and Syphilologists in 1942.

Foreign Letters

LONDON

(From Our Regular Correspondent)

March 6 1943

The Beveridge Scheme

A debate of three days on the Beveridge scheme in the House of Commons has been followed by one of two days in the House of Lords. The situation is well summarized by the *Times*, which describes the government as morally, if not financially, committed to a far reaching program of social advance that includes state financed children's allowances, a national medical service of free treatment for all, a unified social insurance system embracing every section of the community and important changes in old age pensions, widows' pensions and funeral benefit insurance. The scheme is certainly the most comprehensive ever presented by any British government. It has the approval of all the political parties, and criticisms are few and slight, but an acute difference has arisen with the labor party as to procedure.

THE MEDICAL SERVICES

In the House of Lords Lord Dawson (consulting physician to the London Hospital) defined the attitude of the medical profession toward the replanning of medical services, which it had been studying closely for two years. The realization of hopes as regards medicine must be very slowly carried out. They should go step by step in agreement with the different parties. But certain matters were ready to be tackled now. The first was the great importance of bridging over the gap in theory and practice between preventive and curative medicine. They had remained detached because of the gap in their development, which had been disadvantageous to both. Hospital practice and general practice must comprise the care of public and individual health. Health officers must come out of their obscurity and come on to the staff of hospitals and meet regularly their medical colleagues. Medical education must be altered so that a student in the earliest days was told that the building up of health must take the first place. The practice of medicine must become increasingly institutional. Team work was a necessity. The care of child health should take precedence over almost everything else at this moment, because we wanted the children and wanted them well.

We could not construct a great healing service, such as he hoped, except under the skilled guidance of the medical profession. The medical profession could not be expected to be moved about and take its orders from the laity. Under the authority of Parliament, the profession wanted self determination, just as the judicial bench, bar and church looked after their own affairs without let or hindrance. Just as the profession was taking a prime responsibility in putting the proposals forward, so it would expect to take an equal part in their guidance. The medical profession had the difficulty that in order to do good planning it must have collectivism, but it must also have 100 per cent individualism in personal relations.

The Sterilization of Sulfanilamide Powder

The report of a fatal case of tetanus, possibly due to infection from the container of a sulfonamide powder, has led to the calling of a conference of clinicians, bacteriologists and representatives of British chemical manufacturers to consider methods of sterilizing sulfonamide powder for local application, as has already been done in the United States. It has been shown that if sulfanilamide powder contaminated with tetanus spores

is implanted in animals the drug does not prevent the development of tetanus. At a conference recently held between representatives of the Medical Research Council and the Association of British Chemical Manufacturers it was agreed that the Hinson, Westcott and Dunning procedure, adopted in the United States, was suitable for British manufacturers and that the powder thus sterilized should be issued in sterile packages of 5 Gm. But as this procedure would take some time to put into full effect and could not in any event be applied to existing stocks held in hospitals and at aid posts, the conference considered methods suitable for small scale sterilization. It was thought that lack of uniformity in results reported by investigators for a particular method which theoretically should have proved satisfactory was due to minor variations in technique and especially to the known variability of different commercial preparations of sulfanilamide powder as to chemical purity and physical properties. Thus the thermostatic control of a hot air oven without a check on the temperature of the powder itself, was insufficient. Color, and discoloration on heating might depend on the purity, moisture content and particle size of the powder. It was agreed that a powder should not show more than slight discoloration after heating at 150 C for an hour.

For small scale sterilization of sulfanilamide in hospitals three alternative methods were recommended: 1. Dry heat at 150 C for one hour in a paraffin bath using half filled test tubes plugged with sterilized cotton wool and flaming the upper portion of the tubes. 2. Dry heat at 150 C for one hour in an electric oven, with precautions to ensure even heating throughout. 3. Autoclaving in a dressing sterilizer by the technique and with the precautions proposed by W. I. Buckland. For each of these methods to be satisfactory the sulfanilamide powder should not cake or be more than slightly discolored. The recommendations relate only to sulfanilamide, but the paraffin bath technique has been recommended by its author Berry, as suitable for sulfathiazole in hospital practice.

The Ministry of Health's Publicity Campaign Against Venereal Diseases

In a previous letter to *THE JOURNAL* the Ministry of Health's campaign against venereal diseases by an advertisement in the newspapers throughout the country showing their dangers and what those who contracted them should do has been described. Another measure is distribution through the local authorities of three pamphlets prepared by the Central Council for Health Education which are entitled "What Are the Venereal Diseases?" "Facts of Sex for Men" and "Women in Wartime." The nature of syphilis and gonorrhea is briefly explained. The danger of promiscuous sexual intercourse is pointed out, as well as the importance of early treatment. With regard to the danger of becoming the parent of an illegitimate child, men are told that no birth control methods are 100 per cent certain. Those who go overseas are informed that the licensed or tolerated brothels which exist in some countries are hotbeds of disease. To women it is pointed out that the old idea of their place being in the home is disappearing and that the war has tremendously hastened this movement. As a result of it they are working with men more closely and constantly than ever before. The resulting danger and the proper place of sex in life are stated. The danger of exciting men's sexual desire by allowing physical contacts is emphasized. In any case of doubt or difficulty they should consult their doctor or medical officer. Advice can also be obtained in the strictest confidence from the Central Council for Health Education, whose address is given.

Deaths

Edmund Janes Doering ☉ Chicago, Chicago Medical College, 1874, president of the Chicago Medical Society 1886-1887, past president of the Chicago Gynecological Society and the Chicago Medical Legal Society, a governor of the Institute of Medicine of Chicago, a lieutenant colonel in the medical corps of the U S Army in 1918 and since 1922 colonel in the medical reserve corps, served as a surgeon in the U S Marine Hospital Service, in 1918 president of the U S Examining Board of the Medical Reserve Corps, in 1919 was appointed senior surgeon in the U S Public Health Service, appointed district medical officer for Illinois, Michigan and Wisconsin of the Federal Board for Vocational Education in 1919, chief consultant of the U S Veterans Bureau, a founder and fellow of the American College of Surgeons, president of the Illinois division of the medical reserve corps of the U S Army and honorary president of the Chicago chapter, governor of the Military Order of the World War and in 1930 was commander of the Chicago chapter, governor of the National Reserve Officers' Association, 1922-1923, and honorary president of the medical chapter, consulting physician to the Chicago Lying In and Michael Reese hospitals, in 1936 was a member of the board of public health advisers in the Illinois Department of Public Health, in 1916 received the honorary degree of master of science from Northwestern University, editor of the *Chicago Medical Recorder* for many years, aged 88, died March 1, of coronary sclerosis.

Ralph Leonidas Byrnes, Los Angeles State University of Iowa College of Medicine, Iowa City, 1906, specialist certified by the American Board of Internal Medicine, fellow of the American College of Physicians, formerly professor of bacteriology and pathology at the University of Utah School of Medicine, Salt Lake City, professor of pathology, bacteriology and clinical microscopy at the University of Southern California 1915-1916, professor of diseases of the chest at the College of Medical Evangelists from 1919 to 1923, director of the Utah State Board of Health and Laboratory from 1911 to 1915, member of the American Public Health Association, past director and chairman of the committee of the Los Angeles Academy of Criminology, first lieutenant in the Utah National Guard from 1912 to 1915, served as captain major, surgeon and president of the board of tuberculosis examiners in military camps in the United States from 1917 to 1919, founded an endocrine and mental hygiene clinic, Belvedere Health Center, Los Angeles County Health Department, in 1930, on the staffs of the Los Angeles General, White Memorial and California Lutheran hospitals, aged 64, died, February 16, of coronary thrombosis.

Walter Joseph Wherry, Omaha, University of Nebraska College of Medicine, Omaha 1935, member of the Nebraska State Medical Association, Omaha-Council Bluffs Ophthalmological and Otolaryngological Society, Omaha Mid-West Clinical Society and the American Academy of Ophthalmology and Otolaryngology, specialist certified by the American Board of Otolaryngology and assistant secretary-treasurer, instructor in otolaryngology at his alma mater, member of the staffs of the University of Nebraska Hospital, Douglas County Hospital and St. Catherine's Hospital, on the visiting staffs of the Bishop Clarkson Memorial Hospital and Nebraska Methodist Hospital and Deaconess Home, son of the late Dr. William P. Wherry, aged 37, died, April 1, of hypernephroma.

Thomas Arthur Clay ☉ Paterson, N. J., Columbia University College of Physicians and Surgeons, New York, 1903, fellow of the American College of Surgeons, past president of the Passaic County Medical Society, in 1908 county coroner, from 1906 to 1913 was medical inspector of the city public schools, formerly member of the board of health and city health officer, served in the medical corps of the U S Army during World War I, from 1923 to 1928 director of the Paterson Clinic of the state rehabilitation commission, chairman of the American Red Cross, served on the staffs of the Hope Dell Hospital, Preakness, St. Joseph's Hospital and the Paterson General Hospital, where he died, March 13, of cirrhosis of the liver, aged 63.

James Willis Candee, Utica, N. Y., New York Homeopathic Medical College, New York, 1879, member of the Medical Society of the State of New York, at one time secretary of the state board of homeopathic medical examiners, for eight years health commissioner of Syracuse, served as consulting physician at the Syracuse Homeopathic Hospital

and trustee of the Syracuse Homeopathic Free Dispensary, for four years served as supervisor of the town of Forestport, aged 87, died, February 15, in the Masonic Soldiers and Sailors Memorial Hospital of chronic endocarditis and arteriosclerosis.

David Lawrence Satenstein, New York, Columbia University College of Physicians and Surgeons, New York, 1902, associate clinical professor of dermatology and syphilology at the New York Post-Graduate Medical School, Columbia University, specialist certified by the American Board of Dermatology and Syphilology, member of the American Dermatological Association, served on the staffs of the Jewish and Adolph hospitals, Brooklyn and the Far Rockaway (N. Y.) Hospital, aged 63, died, February 25, in the New York Post-Graduate Medical School and Hospital of coronary thrombosis.

Bloxham Edward Alsobrook, Okeechobee, Fla., Atlanta (Ga.) College of Physicians and Surgeons, 1910, formerly associated with the Indian Service, local surgeon for the Florida East Coast and Seaboard Air Line railways, aged 62, died, February 13, in the Arcadia (Fla.) General Hospital of uremia.

James McAllister Anderson, St. Petersburg, Fla., Western Pennsylvania Medical College, Pittsburgh, 1902, member of the Florida Medical Association, at one time on the staffs of the Western Pennsylvania and Pittsburgh hospitals, Pittsburgh, on the staffs of the Mound Park and St. Anthony's Hospital, aged 69, died, February 7, of myocarditis.

Albert George Aschauer, Springfield, Ill., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1909, member of the Illinois State Medical Society, served during World War I, aged 63, died, March 6, in St. John's Hospital of pyloric ulcer.

John Henry Ash, Quincy, Mass., Harvard Medical School, Boston, 1895, member of the Massachusetts Medical Society, for many years a medical examiner for the Metropolitan Life Insurance Company, formerly the city school committeeman, served as a trustee of the Thomas Crane Public Library and as city physician, served on the staff of the Quincy City Hospital, aged 72, died, February 15, of chronic myocarditis.

John Anthony Badgley, Joliet, Ill., Rush Medical College, Chicago, 1880, member of the Illinois State Medical Society, in 1938 received a fifty year medal from the state medical society, formerly medical director of the DeKalb (Ill.) County Tuberculosis Sanatorium, aged 87, died, February 20, in St. Joseph's Hospital of pneumonia.

Louis Bagby ☉ Vinita, Okla., University Medical College of Kansas City, Mo., 1900, past president and secretary of the Craig County Medical Society, served on the staff of the Vinita Hospital, president of the First National Bank, aged 67, died, February 15, of coronary thrombosis.

Frank Gould Bryant, Scranton, Pa., College of Physicians and Surgeons, Baltimore, 1895, served as fire and police surgeon of Scranton, medical inspector for the school district for fifteen years, at one time director of public health in Scranton, aged 70, died, February 28, of carcinoma of the prostate.

James Adam Carnes ☉ Navarre, Ohio, University of Pennsylvania Department of Medicine, Philadelphia, 1907, fellow of the American College of Surgeons, served on the surgical staffs of the Massillon (Ohio) City Hospital and the Aultman Hospital, Canton, chief surgeon of the Central Alloy Division of the Republic Steel Corporation of Canton and Massillon, aged 57, died, February 13, of coronary occlusion.

Edward J. Carney, Durand, Mich., Rush Medical College, Chicago, 1901, member of the Michigan State Medical Society, past president of the Shiawassee County Medical Society, for many years city health officer, past president of the chamber of commerce, served as president of the village of Durand, member of the staff of the Durand Hospital, where he died, February 15, of coronary thrombosis, aged 68.

Edward Francis Carroll, Riverside, R. I., Harvard Medical School, Boston, 1894, served as postmaster, member of the school committee and the city police commission of Providence, aged 71, died, February 15, of heart disease.

Walter Marion Caton, Mason City, Ill., Kansas City (Mo.) Medical College, 1901, University of Kansas School of Medicine, Kansas City, Kan., 1909, member of the Illinois State Medical Society, formerly on the staff of the Lincoln (Ill.) State School and Colony, aged 70, died, February 16, in Lincoln of coronary thrombosis.

John Wesley Cunningham, Eldersville, Pa., Memphis (Tenn.) Hospital Medical College, 1906, member of the Medical Society of the State of Pennsylvania, served as a major

in the medical corps of the U S Army during World War I, aged 72, died, February 5, in the Ohio Valley Hospital, Steubenville, Ohio, of carcinoma of the tongue with metastasis.

Charles Webster Didenhover, Baltimore, University of Maryland School of Medicine, Baltimore, 1894, at one time police coroner for the northern district, aged 70, died, February 14, in the Union Memorial Hospital of cerebral hemorrhage.

Mary Hughes Elliott & Spencer, W Va, National University of Arts and Sciences Medical Department, St Louis, 1914, Bennett Medical College, Medical Department of Loyola University, Chicago, 1916, served overseas during World War I, aged 62, served on the staffs of the Larned (Kan) State Hospital and the Spencer State Hospital, where she died, February 25, of coronary occlusion.

Harry Fleming Fisher, Braddock Pa, Western Pennsylvania Medical College, Pittsburgh, 1892, member of the Medical Society of the State of Pennsylvania, on the staff of the Braddock General Hospital, aged 73, died, February 9, of coronary thrombosis.

Asbury Coke Graves, Pittsburg, Kan, University of Nashville (Tenn) Medical Department, 1882, Vanderbilt University School of Medicine, Nashville, Tenn, 1883, formerly mayor of Pittsburg, at one time a member of the House of Representatives of Kansas, served on the staff of the Mount Carmel Hospital, a consulting eye surgeon to the Kansas City Southern Railway, aged 86, died, February 13, of cerebral hemorrhage.

Charles Burley Ham, Toledo, Ohio, Bellevue Hospital Medical College, New York, 1889, aged 82, died, February 26, of cerebral hemorrhage.

William Stephen Hamlett, Baird, Texas, Kentucky School of Medical, Louisville, 1898, aged 81, died, February 12, in the Callahan County Hospital following an operation for urinary retention caused by prostatic disease.

Martin Passmore Hamrick, Olive, Calif, University of Pennsylvania School of Medicine, Philadelphia, 1911, served during World War I, formerly a captain in the medical corps of the U S Army, on the resident staff of the Riverside (Calif) County Hospital, aged 57, died, February 15, in the Veterans Administration Facility, West Los Angeles, of cerebral hemorrhage.

William McIntire Harsha, Chicago, Chicago Medical College, 1883, member of the Illinois State Medical Society, in 1905 member of the House of Delegates of the American Medical Association, professor of surgery emeritus at the University of Illinois College of Medicine, a founder and fellow of the American College of Surgeons, president of the Chicago Surgical Society, 1916-1917, emeritus member of the Institute of Medicine of Chicago, formerly surgeon to St Luke's Hospital, aged 87, died, February 26, of uremia.

William Anthony Herman, New York, Georgetown University School of Medicine, Washington, D C, 1930, served as a member of the staffs of the Roosevelt and Doctors hospitals, aged 41, died, February 17, in the Lenox Hill Hospital of pneumonia.

Joseph Ellis Hoffman, Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1883, aged 88, died, February 16, of cerebral hemorrhage.

Henry G Hughes, Schenectady, N Y, University of the City of New York Medical Department, New York, 1890, member of the Medical Society of the State of New York, past president of the Schenectady County Medical Society, formerly served as physician and surgeon for the Holland American Steamship Line, Panama Railroad Steamship Line and as chief surgeon of the Guayaquil and Quito Railroad Company of Ecuador, South America, aged 75, died, February 17, of coronary disease.

George W Kehl & Reading, Pa, University of Pennsylvania Department of Medicine, Philadelphia, 1893, in 1910 president of the Berks County Medical Society, fellow of the American College of Surgeons, for many years chief surgeon of the Reading Hospital, where he later became a consulting surgeon, aged 71, died, February 10, of bronchogenic carcinoma.

Charles Henry Krause, St Louis, Homeopathic Medical College of Missouri, St Louis, 1893, vice president and treasurer of the Columbia Quarry Company, aged 69, died, February 8, in St Anthony's Hospital of heart disease.

Louis Lefrak & New York, Long Island College Hospital Brooklyn, 1908, specialist certified by the American Board of Radiology, Inc, member of the Radiological Society of North America, Inc, and the American College of Radiology, clinical

assistant 1921-1922 and instructor 1923-1924, department of roentgenology, New York Post-Graduate Medical School and Hospital, aged 68, died, February 21, of heart disease, following a prostatectomy.

Edward Joseph Leonard & Boston, Georgetown University School of Medicine, Washington D C, 1926, instructor in medicine at the Tufts College Medical School, aged 41, on the staffs of St Margaret's Hospital and the Carney Hospital, where he died February 14, of coronary thrombosis.

Van Buren Martin, Picayune, Miss, Medical Department of Tulane University of Louisiana New Orleans 1898, member of the Mississippi State Medical Association, examining physician for the Selective Service System for local draft board number 1 of Pearl County formerly bank director, superintendent and owner of a sanatorium bearing his name, aged 75, died, February 27, in the Toussaint Infirmary New Orleans of heart disease.

Floyd Napoleon Moore, Austin Texas, Baylor University College of Medicine Dallas 1928, member of the State Medical Association of Texas and the American College of Chest Physicians, medical director of the Austin Travis County Sanatorium, member of the Austin Junior Chamber of Commerce, aged 44, died, February 25, of coronary thrombosis.

Marion W Murphy & Ruggold, Ga, Atlanta Medical College, 1892, president of the Bank of Ruggold, aged 81, died, February 25, of coronary occlusion.

Samuel Gaines Northrup, Houston Texas, Medical Department of Tulane University of Louisiana, New Orleans, 1888, aged 81, died, February 20, of heart disease.

Clell Ping, Summersville, Ky, St Louis College of Physicians and Surgeons, 1923, member of the Kentucky State Medical Association, aged 43, died February 23, of cerebral hemorrhage.

Marion Pinson, Metairie, La, Georgia College of Eclectic Medicine and Surgery Atlanta 1892, at one time a school teacher, aged 83, died, February 26, in Zebulon of cerebral hemorrhage.

John D Poe & St Louis, St Louis University School of Medicine, 1903, served on the staffs of the Evangelical Deaconess Home and Hospital and St John's Hospital, aged 68, died, February 26, in Miami, Fla, of pneumonia.

Henry Jacob Pool & Port Clinton Ohio, University of Wooster Medical Department Cleveland, 1902, fellow of the American College of Surgeons, member of the Radiological Society of North America, Inc, aged 67, died, February 17, of cardiovascular disease.

Michael Thomas Reynolds & Brooklyn, Columbia University College of Physicians and Surgeons, New York, 1901, fellow of the American College of Surgeons, served on the staffs of the Mary Immaculate Hospital Jamaica, N Y, and St Mary's Hospital, aged 64, died, February 27, in St Vincent's Hospital, New York, following an operation on the gall-bladder.

Henry Towne Safford, El Paso Texas, Stirling Medical College, Columbus, 1896, member of the State Medical Association of Texas and the American Society of Anesthetists, Inc, in 1942 was elected the first honorary member of the Texas State Association of Medical Anesthetists, aged 75, member of the executive committee of the Providence Hospital, where he died, February 18, of heart disease.

Elmer Emmett Sherman, Keosauqua, Iowa, College of Physicians and Surgeons, Keokuk, 1898, member of the Iowa State Medical Society, aged 81, died, February 12, in the Iowa Methodist Hospital, Des Moines, of chronic heart disease.

Neulan B Smith, Ellisville, Miss, Medical Department of Tulane University of Louisiana, New Orleans, 1894, while a resident of Laurel served as a member of the board of aldermen of the city and as a member of the board of trustees of the city schools, aged 72, died, February 22, of heart disease.

Henry Smoyer, North Tonawanda, N Y, Niagara University Medical Department Buffalo, 1895, member of the Medical Society of the State of New York, on the staff of the De Graff Memorial Hospital, served as mayor, city treasurer and school physician for ten years, town health officer of Wheatfield, aged 72, died, February 18, of aortic stenosis and arteriosclerosis.

John Willis, Wauwatessa, N J, University and Bellevue Hospital Medical College, New York 1907, served during World War I, formerly chief anesthetist at the Christ Hospital and on the staff of the Jersey City Hospital, Jersey City, served for two years as school physician at the Ocean Township, aged 64, died, February 17, of cerebral hemorrhage.

INTELLECTUAL WORKERS AND PHYSICAL EXERCISE

To the Editor — A little belatedly I wish to compliment you on the editorial "Intellectual Workers and Physical Exercise," which appeared in the January 13 issue of *THE JOURNAL*. The point of view expressed seems particularly desirable at this time when so many of our university departments of physical education are being asked to take over the activity aspects of the military program. I hope a good many men in my profession read it and profit from the thought involved. We here at the Ohio State University are proceeding rather carefully to the fulfillment of our obligations in this connection, and we desire most earnestly to fit the program of physical education for men in uniform rationally and appropriately into their preparation. We are taking the position that it is not our business to devise a program of exercises which will "toughen" these men in any extraordinary fashion, but on the contrary we hope to emphasize a high quality of instruction in useful motor skills and to devise a program which will be as far as possible based on the capacity of the soldier or sailor to receive such physical education as his age and physical condition permits without jeopardizing his ability to profit most from his other responsibilities while on the campus.

It has been my observation that intensive calisthenic or conditioning exercises are not altogether suitable but in their place may be used sound instruction in certain military skills, such as swimming, and a wise selection of games and sports which will have some purpose and interest involved therein and which will at the same time provide a desirable psychologic preparation in the use of initiative and resourcefulness in combat situations.

It is particularly gratifying to us, therefore, to note how closely we agree with what I gather to be the basic view expressed in this editorial.

D. OBERTEUFFER, Columbus, Ohio

Professor of Physical Education, Ohio State University

"ANDROGENS AND TESTICULAR IRRADIATION IN CANCER OF THE PROSTATE"

To the Editor — The communication of Huggins entitled "Androgens and Testicular Irradiation in Cancer of the Prostate" (*THE JOURNAL*, January 9, p. 147), seems to me to be misleading. He states that my quotation "The theorem of possible relationship of some factor in the testicle, probably androgenic, to carcinoma of the prostate was promulgated by me eight years ago" (*THE JOURNAL*, Dec. 5, 1942, p. 1120) refers apparently to an oral promulgation rather than to a publication, since no reference to it could be found among my publications cited in the *Quarterly Cumulative Index Medicus* before 1941.

Before the then Southwestern Branch of the American Urological Association, at the meeting held in St. Louis on Oct. 22, 23 and 24, 1934, in the discussion of a paper by Dr. Robert C. Cone of Galveston, Texas, entitled "Prostatic Carcinoma with

Complications," the theorem of possible relationship between carcinoma of the prostate and testicular hormones was presented and the course of 2 cases recited in which planned irradiation had been given with 650 kilovolts potential in castration dosage to the testicles during the years 1933 and 1934. The scientific proceedings of this meeting were not published.

Referring to my paper read before the American Urological Association in May 1941 (*J. Urol.* 46:1007 [Nov.] 1941), it is set forth that the cases reported were from "the five year period immediately ending in December 1938," and, further, it is stated that at the time of the report "the longest time of survival is seven years." It takes no great amount of mental gymnastics to deduce that the five year period began in 1933 and that the patient surviving longest had his treatment in 1934. Coincidentally, in the series of cases presented by Huggins on the same program in 1941 the clinical effects of surgical castration were observed over a period of only twenty months (*J. Urol.* 46:997 [Nov.] 1941).

The concept of a possible hormonal relationship to carcinoma of the prostate enunciated by me in 1934 was well known to a number of urologists, who evinced a decided interest in the theorem.

I would not detract from the excellent corollary work done by Dr. Huggins in pursuit of the proof of this concept, and to Dr. Huggins must go priority in publication of this proof.

Pertinent to the article by Huggins entitled "Effect of Orchietomy and Irradiation on Carcinoma of the Prostate" (*Ann. Surg.* 115:1192 [June] 1942), he concludes "Roentgen irradiation of the testes in the doses stated is inadequate as a therapeutic agent in human prostatic cancer." In support of this conclusion he cites the 2 patients "in whom roentgen therapy was applied to both the pelvis and testes." A careful review of the histories of both cases reveals that in neither case was roentgen therapy applied directly to the testes as a planned therapeutic procedure. Further, the illustration (fig. 8) depicting the microscopic appearance does not carry the same case number as either of the cases cited. And the description "Histologic appearance of the testes eighty-seven days following completion of extensive irradiation with roentgen ray" does not conform to the described procedure in the case reports. There is no expression or knowledge purveyed of any given amount of x-ray absorption, rather, this factor is entirely assumptive.

Until Dr. Huggins will conduct a parallel series of roentgen and surgical castration cases, he is not in a position to pronounce a negative dictum relative to planned testicular irradiation.

As Huggins states (p. 1192), "Thus, it is clear that there are many failures in the treatment of prostatic carcinoma by orchietomy," so it can be said of irradiation castration that there will be a comparative mortality the first year but the late failures, both mortality and morbidity, are not so manifest.

The contention that interstitial cells are not affected by irradiation is open to question, and whether the interstitial cells are responsible for the carcinogenic related factor is also conjectural. It is irrefutable, however, that this factor in the testicle is sufficiently depressed by roentgen therapy to establish its adequacy as a potent therapeutic agent in human prostatic cancer.

MEDICOLEGAL ABSTRACTS

Accident Insurance Death from Coronary Occlusion Precipitated by Strain of Dancing Not Due to "Accidental Means"—The insured, an able bodied man of 55, about once every two weeks was wont to dance at a meeting of a dancing club to which he belonged, continuously for approximately three hours. During the latter part of the evening of Dec 21, 1940, at a meeting of the club and while the insured was dancing a fast fox trot, he complained to his partner of a pain in his left side and shoulder and he was forced to cease dancing. His son took him to a hospital immediately but the insured died as they arrived at the hospital. According to the attending physician, death resulted from a coronary occlusion or blood clot, which means, so the physician stated, "a blocking of the arterial blood vessels." Specifically, this physician testified

It must have been a thrombosis or a thrombus formed at the entrance to the coronary artery and the violent exercise of dancing increased the flow of blood and forced the clot that had formed there into the coronary artery and produced a complete block.

Suit was instituted on a policy of insurance that provided stated benefits for loss of life "from bodily injuries sustained through purely Accidental Means independently and exclusively of disease and all other causes." From an adverse judgment, the insurance carrier appealed to the Supreme Court of Washington.

The court was called on to determine whether or not death resulted from bodily injuries sustained through purely accidental means and whether or not the bodily injuries which caused death were sustained through accidental means independently and exclusively of disease. If the answer to either question was no, there could be no recovery on the policy of insurance. To support recovery the claimants, apparently the widow and son of the insured, cited a number of cases decided by the Supreme Court of Washington in which recovery had been allowed against insurers for injuries allegedly caused by accidental means. The court, however, did not find any of its previous decisions precisely in point in the present controversy. An examination of those cases, said the court, demonstrates that an unusual unforeseen agency or happening was present and unexpectedly caused the injury which brought about death in each of those cases and brought the facts within the provisions of the policy of insurance sued on. The rule stated in those cases

is that generally death will be regarded as resulting from accidental means when it arises from an unanticipated event which happens as by chance or which does not take place according to the usual course of things. We adhere to that rule but we cannot extend that rule to include all injuries which may be caused to holders of accident insurance. In the present case, the insured was doing an ordinary and customary act in his usual way and no unexpected event interposed itself to cause injury. The dance was described as a fast fox trot. That dance so far as the facts indicate was no different from any other modern lively dance and called for no violent action other than that which was incident to the activity of dancing and was readily foreseeable by the insured. The insured's death was not caused by an unexpected event which happened by chance. True death is in most instances unexpected but to hold that all unexpected deaths are accidental and that insurance companies which insure against accidental death are liable on that ground alone would amount to a rewriting of such policies by the courts and put into each of those policies an intent that was never conceived by either the company or the insured at the time the policies were written. That the courts cannot do. Courts may only determine the legal effect of contracts. The judgment against the insurance company was accordingly reversed.—*Hodges v. Mutual Ben Health & Accident Assn of Omaha* 131 P (2d) 957 (Wash., 1912)

Venereal Prophylactics Alleged Violation of Washington Act Forbidding Sale of Venereal Prophylactics at Wholesale or Retail Except by Licentiate of Board of Pharmacy—A Washington statute (Rem Rev Stat, Sec 10146-2 Laws, 1939, chap 192 sec 2) makes it unlawful for any person to sell any venereal prophylactic at wholesale or retail without having respectively a valid and subsisting wholesale dealer's or retail dealer's license issued by the state board of pharmacy. The defendant drug company was charged with violating this act by the sale at wholesale of two gross of prophylactics without possessing a wholesale dealer's license. The only evidence adduced to sustain the charge was the testimony of an inspector for the state board of pharmacy to the effect that he purchased two gross of prophylactics from the defendant drug company and that at the time of the purchase he was not a person who sold or intended to sell prophylactics directly to the user. From a judgment of conviction the defendant appealed to the superior court King County, which affirmed the conviction. The defendant then appealed to the Supreme Court of Washington, challenging the sufficiency of the evidence to sustain the conviction.

The Supreme Court was of the opinion that the state failed to prove that the defendant drug company was guilty of the crime of selling prophylactics at wholesale. The statute, said the court which the state charged the defendant with having violated defines the meaning of the term "wholesale." We may not go beyond the scope of that definition to determine the meaning of the word "Wholesale," the statute provides "shall mean a sale by a manufacturer, wholesale dealer, distributor or jobber to a person who sells, or intends to sell, direct to the user, and 'wholesale dealer shall mean such a manufacturer, wholesale dealer, distributor or jobber' (Rem Rev Stat, Sec 10146-1, Laws, 1939, chap 192 sec 1). The sale to the inspector for the state board of pharmacy was not a sale at wholesale within the meaning of that statute since the inspector did not sell or intend to sell direct to a user. It is not material at what price the prophylactics were sold by the defendant drug company, neither is the amount sold of any importance, as under the statute price does not nor does the amount sold, determine the nature of the sale. Even if the defendant drug company made the sale to the inspector believing that the purchaser was buying the prophylactics for resale, that belief would not bring the defendant within the statute. We cannot, continued the court, follow the argument that, since the defendant drug company believed that the inspector was purchasing the prophylactics for resale, therefore, the defendant is guilty of the crime charged. An essential element of the crime charged is that the buyer of the prophylactics was a seller or intended to sell what he bought from the defendant drug company.

that element is lacking. Unless the buyer of the prophylactics from the defendant company was a person "who sells, or intends to sell, direct to the user," the transaction was not a sale at wholesale under the statute.

Holding that the state had failed to prove that the defendant company sold prophylactics at wholesale in violation of the statute, the Supreme Court reversed the judgment of conviction and remanded the cause with directions to dismiss.—*State v. Northeast Drug Co., Inc.* 131 P. (2d) 956 (11 Ash, 1912)

(Continued from page 1308)

Influence of Diet Deficient in the Vitamin B Complex on Work Output of Trained Subjects

DRS. E. E. FOLTZ, CLIFFORD J. BARBORKA and A. C. IVY, Chicago. Four medical students were provided with board and room in a hospital. The subjects came to the laboratory for a workout on the bicycle ergometer three times each week. The standard rate of work was 1,235 kilogrammeters per minute with a pedaling rate of 54 revolutions per minute. The subjects worked to complete fatigue, rested ten minutes, then worked to complete fatigue again. Double work periods were used because it was felt that the results obtained were more accurate than those resulting from single work periods. The subjects trained for from nine months to one year, during which time they were on a normal adequate diet. They then received a diet deficient in the vitamin B complex containing approximately 0.51 mg. of thiamine and 0.78 mg. of riboflavin a day. This diet was continued for two months, after which the fat content of each diet was reduced 50 per cent and an isocaloric amount of carbohydrate was added. This diet was continued three weeks. The subjects then received the original deficient diet supplemented with 25 Gm. daily of a yeast concentrate. This provided each subject with a daily intake of 15 mg. of thiamine, 5.25 mg. of riboflavin, 50 mg. of niacin, 5 mg. of pyridoxine and 25 mg. of pantothenic acid in addition to his deficient diet. Vitamin studies of the blood and urine were followed throughout the experiment.

All subjects showed decreased work output on deficient diets. When they were given the yeast concentrate a prompt increase in their total work output occurred. While the subjects were on deficient diets they at no time showed any objective evidences of a vitamin B deficiency with the exception of a slight increase in irritability. The blood levels of thiamine were normal throughout. However, the twenty-four hour urinary excretion of thiamine during this time varied from 5 to 35 micrograms. The subjects complained of lack of pep and of anorexia, leg pain occurred sooner during the work periods. The percentage of recovery was not significantly affected.

DISCUSSION

DR. ENMET B. BAY, Chicago. I should like to ask the authors if the blood pyruvate was the same after exercise as in the resting period. I understood that it did not vary on different diets. The figures shown would represent a great increase over what I understand to be the normal resting levels.

DR. E. E. FOLTZ, Chicago. The pyruvic acid values were those obtained following exhaustion. I did not have graphs showing them following rest.

Nutritional Deficiency and Resistance to Infection in Monkeys

DR. H. E. WILSON, S. SASLAW, PH.D., J. L. SCHWAB, PH.D., DR. O. C. WOOLPERT and DR. C. A. DOAN, Columbus, Ohio. Monkeys were isolated and divided into four diet groups. 1. Diet 1, vitamin B free basic diet consisting of sucrose, casein, vegetable oil, cod liver oil and salt mixture with the addition of thiamine hydrochloride, riboflavin, pyridoxine, nicotinic acid, calcium pantothenate and ascorbic acid. 2. Diet 2, all of the constituents of diet 1 with the addition of choline chloride, pimeic acid, glutamine, inositol and sodium paraminobenzoate. 3. Diet 600 (modified Goldberger), and 4. control diet consisting of the vitamin B free basic diet with the addition of ascorbic acid and crude liver extract administered parenterally. All 4 monkeys on the control diet thrived. All 32 in the other three groups showed progressive weight loss followed by lethargy, dryness of the coat and finally anorexia and weakness. Four monkeys on diet 600 showed a relatively rapid clinical decline and also exhibited extensive ulcerated oral lesions, which began to develop between the twenty-first and thirty-third diet days.

Minor degrees of transitory gingivitis appeared in about half the monkeys on diets 1 and 2 between the twenty-first and forty-fourth diet days, many of which lesions healed spontaneously.

All 32 animals in the three diet deficient groups exhibited an appreciable and progressive leukopenia, which appeared after six to eleven weeks in the monkeys on diet 600 and after four to fifteen weeks in those on diets 1 and 2. Significant degrees of anemia developed in less than half of these animals.

Eight of the nutritionally deficient animals were inoculated under light ether anesthesia with influenza virus type A. Five died in from two to eleven days. Influenza virus A was recovered from the lung filtrates of 3 animals. There were no deaths in 27 similarly inoculated monkeys on adequate diets.

Six animals while on the limited diets were inoculated with *Streptococcus hemolyticus* group C. Following inoculation an abortive ineffective, minimal leukocytosis was observed, in sharp contrast to the pronounced, sustained effective leukocytosis previously reported as developing in control monkeys on adequate diets. Of these 6, 3 developed facial erysipelas and 5 died with generalized septicemia seven to thirteen days after inoculation. Of 32 monkeys on normal diets receiving similar inoculations, 2 died with a streptococcal septicemia fifteen and twenty-one days afterward.

The humoral antibody responses to both streptococcus and virus did not differ essentially in time or titer in any of the groups from that observed in normal monkeys. Bone marrow studies have shown a relative and absolute hypoplasia in the myeloid elements in the infected monkeys dying with peripheral leukopenia.

Certain monkeys on diets 1 and 2, developing leukopenia and, given liver extract or yeast autolysate residue containing folic acid, showed hematologic and clinical recovery. Others which had apparently progressed to an "irreversible phase," succumbed to spontaneous infection despite all resuscitative measures.

Of the 19 animals which were not experimentally infected while on the leukopenia producing diets 10 succumbed with spontaneous infections, 7 died with dysentery (*Shigella paradyenteriae*) between the eighty-fifth and one hundred and eightieth diet days and 1 died of *Staphylococcus aureus* septicemia, 1 of pneumonia due to *Friedlander's bacillus* and 1 with hemolytic streptococcus pneumonia.

Influence of Thiamine on Induced Hyperthyroidism

DR RAY D. WILLIAMS and EDWARD C. KENDALL, PH.D., Rochester, Minn. Two physically healthy women, maintained continuously on a basal diet providing only 0.22 mg. of thiamine per thousand calories but adequate in all other respects received large doses of desiccated thyroid gland (subject 1, 0.6 Gm. a day; subject 2, 0.5 Gm. per day) for 241 days. Besides the periods of preliminary and subsequent observation the study was divided into three periods: thiamine hydrochloride was liberally provided during the first period of twenty-two days, it was restricted to 0.45 mg. a day during the second period of one hundred and thirty-six days; it was provided in increasing amounts during the third period of eighty-one days. The basal metabolic rates of the subjects rose to approximately +25 per cent during the initial period of administration of thiamine and desiccated thyroid. The rates of the two subjects fell to levels as low as -8 per cent and +11 per cent respectively during the period of restriction of thiamine but they rose consistently to levels of +25 and +30 per cent respectively in the third period when thiamine was again provided. Throughout the period of administration of desiccated thyroid the concentrations of pyruvic acid and lactic acid in the blood after administration of dextrose were high, but they were higher during the period of restriction of thiamine.

The conclusion appears justified that the thyroid hormone is less effective in promoting metabolic activity of the organism in a state of thiamine deficiency than it is when the intake of thiamine is adequate. Data of this study may be interpreted

as additional evidence that the function of the thyroid hormone is primarily to mobilize metabolites for oxidation by enzyme systems of the organism and only indirectly to increase the rate of oxidative processes. It might be inferred that deficiency of thiamine may be a contributory cause of low metabolic rates of unknown etiology. If low metabolic rates of a given subject were caused by deficiency of thiamine, it might be expected that a rise of metabolic rate would follow administration of thiamine. However, a rise of metabolic rate could occur only if the functional capacity of the thyroid gland was adequate. It is not improbable that thiamine deficiency of long standing induces as irreversible changes in the thyroid gland as in nervous structures. The gland may become exhausted from prolonged stimulation or atrophied from disuse.

Relationship of Estrogens to Certain Signs in Hepatic Diseases, Pregnancy and Vitamin B Complex Deficiency Syndromes

DR WILLIAM BENNETT BEAN, Cincinnati. During the past five years a study has been made of the acquired arterial "spider" of the skin and a number of related phenomena which may occur during the course of diseases of the liver, pregnancy, and in persons with B complex deficiency syndromes as well as in certain apparently normal ones. Data have been accumulated on 251 cases which have been followed for weeks, months or years. Among the associated stigmas observed are palmar erythema, telangiectases of the nasal, oral and rectal mucous membrane, aneurysmal dilatations of the conjunctival vessels and vascularization of the skin of the nose. Seen less frequently were aberrations of menstrual function including amenorrhea and after the menopause a return of irregular bleeding. Impotence, testicular atrophy and a transitory or permanent depilation of the pubic, axillary and thoracic hair were found in some males. These signs appeared in various combinations.

These observations attracted attention to the relation of estrogenic function and hepatic dysfunction to the vascular changes in the skin. A preliminary study of administering estrogenic 17-ketosteroids in cirrhosis in "remission" indicated that many of these manifestations might be related to a protracted increase of circulatory estrogens such as occurs in pregnancy and in chronic liver disease when these substances are not sufficiently destroyed, altered or excreted by the liver.

Points in the differential diagnosis of vascular "spiders" and the lesions of hereditary hemorrhagic telangiectasia (Osler's disease) include characteristic differences in gross morphology, histology, distribution, local intravascular pressure, bleeding tendency and the clinical course of the two distinct conditions.

These studies suggest that cutaneous arterial "spiders," palmar erythema and certain other phenomena which occur frequently in cirrhosis and pregnancy result from a prolonged action of estrogens.

DISCUSSION

DR C. J. WATSON, Minneapolis. I should like to ask Dr. Bean if he has any explanation for the strict localization of these lesions to the upper part of the body. From my experience and what I have found in the literature they seem to be limited, as in Dr. Bean's cases, to the upper part of the body.

DR PHILIP S. HLACH, Rochester, Minn. Dr. Bean's statement that cutaneous arterial spiders and palmar erythema occur frequently in cases of hepatic cirrhosis and in cases of pregnancy is of special interest to me because pregnancy and hepatitis with jaundice are two conditions which may promote a dramatic amelioration of rheumatoid arthritis. I have seen several cases of severe rheumatoid arthritis with a striking erythema of all the terminal phalanges and other cases with palmar erythema, the so-called liver palm. I have not seen vascular spiders in rheumatoid arthritis, but curious lines of telangiectasia across the lower anterior chest are often seen in patients with ankylosing spondylitis (and admittedly also in

certain "normal" persons) It is difficult to know what these observations signify Do they suggest again that rheumatoid arthritis is somehow related to an abnormal hepatic or estrogenic function?

DR ARMAND QUICK, Milwaukee Do these tissues bleed more frequently than in the Osler's disease or hereditary telangiectasis?

DR WILLIAM BENNETT BLAN, Cincinnati Out of about 3000 "spiders" I have seen 11 on the body below the umbilicus, 1 on the toe a couple on the dorsum of the foot, 2 about the knee and others on the thigh and buttocks so that the statement that they do not occur on the lower extremity is not true Why the most usual distribution is in the upper portion of the body I do not know I do not think there is a causal relationship to the drainage area of the superior vena cava as suggested by Eppinger I have seen palmar erythema in patients with the painful shoulder and hand syndrome following acute infarction of the heart No one seems to know just what causes it We know there may be a costal fringe of vessels in tuberculosis but it may occur in the healthy too Hemorrhage is almost a necessary factor in the diagnosis of hereditary hemorrhagic telangiectasis It occurs in less than 5 per cent of vascular spiders, though it may happen readily in the lesions on the mucous membrane are rather large and superficial In hereditary telangiectasis there is atrophy or loss of muscular coat of the artery whereas in vascular spiders there is hypertrophy of the muscular coat of the artery with a good many 'glomus' cells resembling the pericytes of Zimmermann Vascular spiders are distinctly not arteriovenous shunts in the sense that a glomus is

Causes of Drop of Plasma Vitamin A Level in Liver Disease

DR HANS POJER and FREDRICK STEINMANN, Chicago We compared the vitamin A concentration in the plasma with that of liver biopsy specimens chemically and by fluorescence microscopy in 76 cases (peptic ulcers gallbladder disease with and without jaundice carcinomas of the stomach cirrhosis and biliary tract cancers) In addition the plasma vitamin A level in 24 nonsurgical cases of liver disease was determined Plasma vitamin A levels of zero were found in almost all cases of cirrhosis with jaundice and in 66 per cent of the cases of secondary hepatitis due to malignant obstructive jaundice Occasionally vitamin A levels of zero were also found in cirrhosis without jaundice, in cases of secondary hepatitis from incomplete obstruction and in cases of acute hepatitis The average plasma vitamin A level was higher in cirrhotics without jaundice than in those with jaundice, and higher in obstructive jaundice without than with hepatitis Although the hepatic vitamin A concentration showed similar tendencies, the variations were not always as definite Often this resulted in great discrepancies between the low or zero vitamin A concentration in the plasma and the only slightly reduced vitamin A in the liver In these cases the normal fluorescence microscopic distribution of vitamin A in the liver was much disturbed and this disturbed pattern suggested impaired release of vitamin A from the liver to the blood as the cause of the discrepancy mentioned In rats intoxicated with carbon tetrachloride and then put on a vitamin A deficient diet the vitamin A is similarly found stored longer in the pathologic sites Although faulty intestinal absorption of vitamin A is present in all types of liver disease (personal experiences in 52 cases confirmed older reports) it would not make itself felt in acute liver disease if the release of vitamin A from the liver was not impaired

DISCUSSION

DR G E WAKERLIN, Chicago Epinephrine by injection and also ethyl alcohol by mouth have been shown to mobilize vitamin A from the normal liver I think it would be interesting to study the effect of these two substances on the

mobilization of vitamin A from the livers of patients with hepatic disease and from the livers of animals with experimental hepatic damage

DR HANS POJER, Chicago We consider the suggestion of Dr Wakerlin as to the use of alcohol a good one in view of the results of Clausen and his collaborators, who find increased release of vitamin A from the liver after alcohol ingestion Wald also found increased release after use of epinephrine Our examinations of pathologic livers did not indicate the occurrence of an increased release of vitamin A We will, however, accept the suggestion of Dr Wakerlin and investigate the influence of alcohol on the blood vitamin A level of patients with liver disease

Protective Value of Foods in Experimental Cirrhosis

DR JESSE L BOLLMAN, Rochester, Minn When extensive hepatic degeneration is produced in rats by repeated exposure to carbon tetrachloride the animals develop hypoprothrombinemia and die from hemorrhage into the gastrointestinal tract In these experiments adult male rats were fed 20 Gm daily of a basic diet containing 44 parts of lean meat, 44 parts of cracker meal 8 parts of lard, 4 parts of salt mixture and vitamin supplement With the uniform exposure to carbon tetrachloride vapor used in all experiments, these rats lived from thirty-two to forty-six days In another group of experiments one half of this mixed diet was replaced with isocaloric values of carbohydrate (cracker meal and sucrose), protein (meat) and fat (lard) Considering the duration of life of the rats on the mixed diet as representing a protective value of the diet of 100 the following protective values were obtained carbohydrate 146, protein 100 and fat 91 In another series three fourths of the mixed diet was replaced with isocaloric values of carbohydrate protein and fat With the protective value of the same mixed diet as 100, the following protective values were obtained carbohydrate 205, protein 104 and fat 59 All the diets used were adequate to maintain normal animals

The only organ that showed cellular degeneration other than that immediately associated with hemorrhage at the time of death during the carbon tetrachloride regimen was the liver Examination of sections of the liver showed extensive necrosis, some regeneration and distortion of the architecture of the liver typical of cirrhosis In animals studied at the time of death no definite differences in the extent of degeneration or cirrhotic changes in the liver were observed which could be ascribed to the different diets taken by the animals Examination of sections of liver taken from animals at comparable periods of the carbon tetrachloride regimen showed evidence of the protective effects of the diets The greatest amount of necrosis was present in the fat fed rats and the least in those fed carbohydrate Regenerative changes were most evident in the animals receiving the protein diet

DISCUSSION

DR SAMUEL SOSKIN, Chicago My associates and I have been doing some work similar to that of Dr Bollman, except that we have been using more acute exposure to carbon tetrachloride We do not wait until the animals die but examine them at various periods before death Although our results are not yet complete, it looks as if they will agree with Dr Bollman's in showing the protective action of carbohydrates Most of Dr Ravdin's results are based on the comparison of an intake of a superabundance of protein with a diet insufficient in protein While we all know that a diet rich in protein would be beneficial to persons suffering from protein deficiency, this has little to do with the use of a superabundance of protein in hepatic disease A more valid comparison is the use of a superabundance of a given foodstuff when the other elements of the diet are present in adequate amounts In Dr Bollman's work this comparison indicates the superiority of high carbohydrate intake as a life saving measure in carbon tetrachloride cirrhosis Our results support his

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Microscopic Appearance of Endometrium.—Among 145 endometrial biopsies done six to thirty one weeks post partum of 28 normal lactating women during the period of lactation amenorrhea. Hopkins observed that 9 (6 per cent) showed progestational changes, all of these were associated with the onset of the first menstrual flow. Of the remaining 136 specimens 94 per cent showed estrogenic changes, and of these 20 were hypoplastic. During lactation the ovarian cycle is suppressed and its suppression results from suppression of the gonadotropic activity of the hypophysis. This has been shown by animal experimentation. The suppression of the pituitary gonadotropic activity in turn is due to the action of prolactin or to an internal secretion of the lactating mammary gland not as yet isolated.

Sulfanilamide and Sulfathiazole Therapy in Acute Salpingitis.—Barrows and Labate used sulfathiazole and sulfanilamide alternately in the treatment of 71 patients with initial attacks of acute salpingitis and 133 during an acute exacerbation of chronic salpingitis. Gonococcal endocervicitis and urethritis responded well to chemotherapy. All the positive spreads of patients became negative after treatment as judged by the reading of smears. The effectiveness of chemotherapy on gonorrheal lesions above the level of the internal os depends directly on the duration of the disease before therapy is begun and on the extent of tubal damage incurred. In 70 per cent of the patients with mild and 66 per cent of those with a moderate initial attack of less than five days complete resolution of adnexal masses was seen after one week of chemotherapy. There was no adequate response of primary salpingitis of a

duration of more than five days and of recurrent salpingitis in the moderate or severe groups. Permanent damage of the tubes may be prevented or minimized if chemotherapy is started within five days of an initial attack of adnexal disease.

Management of War Injuries to Thorax.—Forsee and his associates state that an equally mobile system of evacuation and treatment soon after injuries are incurred is necessary to reduce fatalities from thoracic war injuries. This entails properly equipped medical installations which can function at the point of maximum casualties close to the battle front. The more important problems that enter the management of thoracic injuries, and that the authors discuss are the relation of the wound to the type of projectile, shock, hemorrhage, open pneumothorax, tension pneumothorax, interstitial pulmonary emphysema, massive collapse of the lung and contrecoup injury, "blast lung," ecchymotic mark, cardiac concussion, wounds of the heart and pericardium, cardiac resuscitation, acute and chronic emphysema, foreign bodies, combined abdominothoracic wounds, chemotherapy and anesthesia. All these factors are considered by the authors. In thoracic injuries the abnormal thoracic physiology must be corrected immediately, that is an open pneumothorax or sucking wound must be closed. Concomitant and later therapy must conform to the principles outlined in correcting the abnormal physiology. A tension pneumothorax must be relieved. The recognition of massive pulmonary collapse and treatment directed toward its reexpansion will greatly lessen the complications which frequently follow this condition. The anesthetic agents for extrapleural thoracic surgery are local (procaine hydrochloride), sodium pentothal, ether, nitrous oxide and oxygen with or without ether and cyclopropane. The anesthetics for intrapleural surgery are cyclopropane, nitrous oxide and oxygen, ether, sodium pentothal and spinal anesthetic (1:500). Nitrous oxide, oxygen and ether and sodium pentothal should be used as near the front as necessity requires. Properly employed endotracheal anesthesia will be highly successful in the management of many wounds of the chest. Likewise the greater use of cyclopropane is advisable.

Acute Respiratory Infection.—An acute infectious disease of the respiratory tract with unusual pathologic pulmonary changes in 40 patients is described by Duggan and Powers. The condition closely resembles the pneumonia occurring in workers in the United States and abroad. The illness of most of the patients began as a simple respiratory infection with minimal respiratory and constitutional symptoms, a normal or slightly elevated leukocyte count and no abnormal physical signs. The diagnosis was usually roentgenographic and usually it could not have been made by any other means. The roentgenogram usually showed a small area of increased density most often located at the base or hilus of one lung. Abnormal physical signs in the lungs, manifested by crepitant rales, were not apparent until the peak of the severity of the disease had passed. Although the constitutional symptoms were not severe, convalescence was prolonged because of weakness. There is some evidence that the disease is caused by a filtrable virus. It is

apparently mildly contagious and is probably transmitted by casual contact. Lack of physical fitness, previous infections of the upper part of the respiratory tract, abnormal exposure or physical fatigue were not predisposing factors. The disease did not respond favorably to sulfonamide therapy. Many factors remain to be studied before the entire field of acute respiratory infections can be charted, and particularly is this true of those caused by a filtrable virus. The authors agree with Frances that this can be achieved only by clinical epidemiologic methods and that a comparison of the clinical differences in patients and epidemics with specific laboratory data will cause the various puzzling entities of respiratory disease to fall into their proper places.

Patent Ductus Arteriosus Report of Two Cases F T Joyce Chickasha—p 6
Radiologist's Viewpoint in Treatment of Some Common Diseases E D Greenberger, McAlester—p 12

Patent Ductus Arteriosus—Joyce cites 2 cases of patent ductus arteriosus, 1 illustrates what may happen in such a case in which the operation has not been performed and 1 is an unusual case of dwarfism in which the operation should be done. It seems safe to assume that the death of the first patient, a man of 31, was caused by a complication of the treatment for a bacterial endarteritis which in turn was a complication of the patent ductus arteriosus. Had ligation been done early in life the contributing cause of death would have been removed and it seems likely that he could have lived longer with the aortic coarctation as many patients do with more severe coarctation. Congestive heart failure may have been forestalled for some time. It is questionable whether the retarded physical development of the second patient, a girl of 6 was related to the patent ductus arteriosus, as her stature was of the type seen in pituitary dwarfism. She was referred to a well known clinic for ligation of the ductus, but the operation was not advised, the only reason given was that she should be observed for a time—now, almost a year. Regardless of the etiology of the dwarfism, which in itself will not shorten her life, the possibility that subacute bacterial endocarditis will develop sooner or later remains. Every sore throat and infection of the upper part of the respiratory tract constitutes an obvious invitation for its development in her present condition. The unfortunate aspect of the case is that the parents returned home firmly convinced that the operation will never have to be done.

*Perforating Wounds of Abdomen E L Rippey Nashville—p 20

Perforating Wounds of Abdomen—Based on data from a study of 527 cases of penetration of the peritoneal cavity by either a bullet or a knife, Rippey declares that explorations should be carried out whenever the point of exit or entrance of the knife or bullet is in the region of the abdominal cavity. The mortality from perforations resulting from bullets was four

times as high as when the perforation was the result of a knife blade. Hemorrhage is the greatest cause of shock, death will result unless hemorrhage is controlled and the blood volume is restored. In doubtful cases of injury to the peritoneum by the knife the wound should be examined in the emergency room and enlarged if necessary to ascertain its depth. If the blade has penetrated the fascia and muscle, further exploration is done in the operating room, under local anesthesia. The wound is enlarged and the muscle is retracted so that the peritoneum can be examined for evidence of injury. If the peritoneum has been penetrated the patient is given a general anesthetic and exploration is done through the diagnostic incision or else a standard incision that will allow careful examination of the abdominal organs is made. The mortality and the fatality rate of patients with wounds caused by knives or bullets increase steadily with the time that elapses from injury to operation. As to the use of sulfonamides intraperitoneally, patients do better if a concentration between 10 and 12 mg is maintained in the blood. The general average mortality for gunshot wounds for the nineteen years under consideration was 58.9 per cent whereas for 1941 it was 31.9. The 12.5 per cent mortality for wounds caused by the knife was lower than in any other series reviewed.

Gastroschisis—Watkins cites the case of an infant who has lived for five weeks (May 6 1942) after repair of a gastroschisis. Gastroschisis is to be differentiated from abdominal hernia. In true gastroschisis the continuity of tissue in the abdominal wall, which permits direct communication between the abdominal cavity and the outside is absent. The author attributes the success in his case to the fact that there was less disproportion than usual between the everted viscera and the abdominal cavity and that dehydration was combated early and frequently by giving isotonic solution of sodium chloride subcutaneously. Also the use of prostigmine seemed to stimulate intestinal peristalsis, after which the baby began to retain feedings. The abnormality was repaired early that is before symptoms of shock and systemic effects had taken place. Further sulfanilamide, used in the abdominal cavity, lessened the degree of peritonitis as evidenced by the absence of wound infection.

*Five Hundred Cases of Myalgia in the British Army. M. Cood.—p. 118.

Myalgia in the British Army—Good discusses the 500 cases of myalgia that he saw in a main dressing station several inspection rooms and a rheumatism ward of a military hospital. Most of the patients were successfully treated by injection of procaine hydrochloride. Myalgia of the leg or legs was the most frequent complaint, next in frequency was that of the hip, the dorsal and lumbar region, the neck, arm, shoulder, abdomen and chest. Study of the individual muscles involved shows that the quadratus lumborum and trapezius were most frequently affected, the tensor fasciae latae, glutei, semimembranosus, tendinosus and sacrospinalis. Myalgia of the triceps, the adductors and extensors (except lateral vastus of the leg) was not encountered. The reason for the frequency of myalgia of certain muscles is suggested by Bramwell, who states that muscles which are of special importance as fixators in relation to maintenance of posture are predisposed. The primary cause (or causes) of rheumatic myalgias is not known. In 22.6 per cent of the 500 cases myalgia was traced to a recent or previous injury. In the discussion of the pathology of myalgia the conception of a diminished blood supply in the myalgic area is tentatively put forward. This would lead to oxygen want—local hypoxemia or hypoxia—which would account for the paresthesia and loss of power, the symptoms of myalgia. A rapid, effective and permanent cure can be obtained by intramuscular injection into the myalgic spots of 1 to 2 cc of a solution made up of 1 Gm of procaine hydrochloride, 0.5 Gm of phenol and enough saline solution to make 100 cc. The result of a thorough and accurate injection is almost instantaneous relief of pain, relaxation of the spastic muscle and the absence of pain from pressure on the myalgic spot. The reaction of a patient with genuine myalgia to pressure on the myalgic spot is immediate pain and a single jerk of a part of his body.

*Treatment of Chronic Ulcerative Colitis by Pneumoperitoneum. H. Neumann.—p. 9.

Some Observations on Biliary Pain. A. A. Douglas.—p. 10.

Treatment of Chronic Ulcerative Colitis by Pneumoperitoneum—Neumann has obtained excellent results in chronic, apparently intractable, cases of colitis by the establishment and maintenance over several months of a therapeutic pneumoperitoneum. The patient is not confined to bed except for a few days, and his hospitalization can be limited to a short time. The clinical indications for pneumoperitoneum were chronicity, diarrhea, pus, mucus and blood in stools and intractability. Refilling can be done once or twice a week, when pure oxygen is used the intervals are three or four days because absorption is more rapid. When air is used the intervals are six to eight days. Oxygen, because of its calming effect, is preferable for the first fillings for patients with major abdominal discomfort and frequent colic and for those with a higher grade of secondary anemia and dyspnea. The number of fillings

varies greatly, it may be necessary to continue treatment for three months or more. Only 1 of the author's 7 patients was treated for more than three months. The therapeutic action of pneumoperitoneum is probably partly due to relaxation of the visceral peritoneum and to "tuning it to a higher pitch" by the setting up of a permanent bland irritation to the peritoneal surface and partly to the mechanical action and the indirect influence on the autonomic nervous system. Pneumoperitoneum is free enough from danger for it to be performed by any practitioner even without the facilities of a clinic or a hospital.

Sulfonamide Resistance in Gonorrhea—Petro bases his definitions and observations on 956 cases of acute gonorrhea in which patients treated with sulfapyridine or sulfathiazole. Sulfonamide resistance in gonorrhea may be acquired, relative and absolute. An *in vivo* and *in vitro* investigation of 44 cases of male gonorrhea shows that 5 resistant strains and 1 relatively resistant strain of gonococci were responsible for the failure of 6 patients to respond to adequate sulfonamide treatment. Investigation of the female hosts of one sulfonamide resistant strain of gonococci supported the view that such a strain can be transmitted from one host to another. The development of resistant strains is probably favored by inadequate doses of a sulfonamide, haphazard tests of cure and the premature cessation of treatment in defaulters. Until new compounds effective against sulfonamide resistant strains are evolved or means for re-sensitizing these strains are found, treatment of patients infected with a sulfonamide resistant organism must be by irrigation or artificial fever.

Deficiency Anemias of Malnutrition—Trowell reviews the knowledge of nutritional macrocytic anemia, a common anemia in both sexes when the diet is deficient in extrinsic factor. The failure to recognize this anemia and its refractoriness to many forms of liver in the form and dosage found potent in pernicious anemia might cause confusion with alcoholic anemia, alcoholic neuropathy of the acquired variety and refractory and aplastic anemia. When iron deficiency anemia and nutritional macrocytic anemia are both present the resulting anemia presents a confused picture difficult to recognize. The term dimorphic anemia should be given to this combination. This may well be the most common deficiency anemia of the very poor, and the very poor are not confined to the tropics. Two deficiencies play a part in the etiology of dimorphic anemia. The blood smear shows dimorphism between the central and the peripheral parts of the smear; the sternal puncture reveals two deficiency types of erythropoiesis and two factors are necessary in its treatment: iron and liver.

*New Remarks on the Remedy to Apply to the Grave Deficiency of the Present Diet in Phosphorus, Calcium and Vitamin D and the Urgency of This Remedy H. and M. Hinglais — p. 171

Postoperative Acute Digestive Disturbance Disturbance of Digestive Permeability P. Sire — p. 173

Deficiency of Present Diet in Phosphorus, Calcium and Vitamin D—H. and M. Hinglais say that a year ago on Feb 18 1941 they placed in the hands of the rationing committee a memorandum on the extraordinary impoverishment of the present diet in calcium phosphorus and vitamin D pointing out that the deficiency is enormous in all subjects over 6 years old. They also called attention to the prevailing misconception that vitamin D by itself can be of value in the absence of sufficient amounts of phosphate and calcium in the diet. This "factor of utilization" can never be substituted for the essential building and maintenance materials phosphorus and calcium. A plan of correcting the diet which was compatible with the present possibilities and realizable on a large scale in groups and families was presented by the authors but no attempt having been made to put it into practice they report that the deficiency in phosphorus and calcium reduces the resistance and burdens most heavily the future of the young generation. In one graph they show the calcium deficit for the different age groups and in another one the vitamin D deficit. The calcium and phosphorus deficits are comparatively slight in children up to 6 years old, but after that they grow because the ration becomes smaller as the need increases. Children between 6 and 10 years receive less than half, those between 12 and 14 less than a third and after 14 less than a tenth of their requirements. In pregnant and nursing women the deficiency is likewise considerable. This great deficiency in phosphorus and calcium is due to the total or almost total disappearance of milk and its products from the diet. Other foods are extremely low in calcium and phosphate. The systematic employment of calcium phosphate associated with a suitable dose of vitamin D constitutes the only available remedy to compensate for the lack of milk. It must be made a part of the daily diet. A table lists the required daily doses of phosphorus, calcium and vitamin D for the different age groups. The urgency of the problem of supplying particularly school children and young people with adequate amounts of phosphorus, calcium and vitamin D is proved by the increasing frequency of fractures of the neck of the femur in young adults, by the increase in rickets and in osseous and dental decalcifications.

*Chronic Coryzas and Vitamins A. Vidal Freyre — p. 142

Chronic Coryzas and Vitamins—The frequent observation of children who "always have a cold" and whose coryza does not respond to the various local treatments induced Vidal Freyre to try the nasal instillation of vitaminized oils. He used a vitamin A preparation. Five drops were instilled three times a day into each nasal fossa. The results were quite favorable. The treatment was completely successful in 18 of 41 cases; there was considerable improvement in 8 cases, moderate improvement was obtained in 8 and the treatment failed in 7 cases. The favorable effect can probably be explained by the protective action of vitamin A on the epithelium. It can be employed pure or in combination with small doses of vitamin D. Before treating a chronic rhinitis it is of course essential to determine the cause,

for it would be ridiculous to try to cure a diphtherial coryza with instillations of vitamin A. Syphilis and tuberculosis should be investigated, because these diseases may sustain focal infection. Spasmodic rhinitis or nasal asthma is another type of chronic coryza. Tonsillar hypertrophy and adenoid vegetations produce obstruction and favor and maintain all types of catarrhs of the upper respiratory passages. Their early extirpation is advisable. Disregarding these cases as well as the syphilitic coryzas, there still remains a large number of children with chronic nasal catarrh. For these the author recommends the local application of vitamin A.

21 101-232 (Aug) 1942 Partial Index

*New Sulfonamide Preparations in Therapy of Bacillary Dysentery F. Abente Haedo and A. Rodriguez Devincenzi — p. 115

*Genital Brucellosis in Man P. Puerruel, R. Risso and J. Espasandin — p. 128

Sulfonamide Compounds in Bacillary Dysentery—Abente Haedo and Rodriguez Devincenzi report good results from sulfonamide preparations in 16 cases of bacillary dysentery. In all the diagnosis was confirmed by laboratory tests which showed bacilli of Flexner's group in the feces. The group included children and adults. The authors emphasize the importance of early diagnosis and early sulfonamide therapy. The first dose of the drug (sulfathiazole) should be large (2 or 4 Gm. for adults and 0.75 or 1 Gm. for children). The daily dose for adults is 1 Gm. every four hours day and night without any interruption until recovery, which as a rule occurs within two or three days. The total daily dose for children who weigh less than 10 Kg. varies between 0.15 and 0.4 Gm. for each kilogram of body weight. The total dose is divided in six equal fractional doses, each of which is administered every four hours. In children weighing more than 20 Kg. the first and daily doses for each kilogram of body weight are smaller than those given to children under 20 Kg. of body weight. The first dose of sulfaguanidine both for adults and for children is 0.1 Gm. for each kilogram of body weight, the following dose is 0.05 Gm. for each kilogram of body weight every four hours day and night for the first two days and the same dose every eight hours for two more days. During and after treatment the patients should drink liquids freely. If good results are not manifested during the first week of the treatment it should be discontinued. In no case is the drug given for more than two weeks. Ascorbic and nicotinic acids, thiamine hydrochloride, vitamin A and liver extract should be administered in the course of the treatment. The patients should be carefully observed for the possible appearance of adrenal insufficiency, which is a serious complication and calls for immediate proper therapy.

Genital Brucellosis in Men—Puerruel and his collaborators report 6 cases of acute or chronic brucella epididymitis without orchitis in workers in refrigerator meat plants. The acute form of the disease began with symptoms of general infection and fever in the course of which acute funicular scrotal and testicular pain either local or irradiating to one or the four limbs appeared. Acute inflammation of one testis appeared early in the disease. It was found by palpation that the testis was of normal form and consistency whereas the epididymis was the seat of acute inflammation, which was more acute at the head and tail of the structure than at the body. Subacute vaginitis with effusion, subacute prostatitis and vesiculitis existed in some cases. The chronic form of the disease appeared in patients who complained about asthenia of long duration or about repeated attacks of moderate fever. The genital symptoms were more or less mild. They appeared in course of one of the attacks of recurrent fever. The chronic genital disease was either unilateral or bilateral. Small painless nodules could be palpated in both testes. The biologic tests for Brucella (intradermal test for allergy and seroagglutination test) were strongly positive in all cases and remained positive throughout illness and convalescence. Therapy during the acute period and the recurrences consisted of rest, local heat and sulfanilamide.

Book Notices

Laboratory Directions in Biochemistry By Victor C. Wiersma, M.A., Ph.D., D.Sc., Professor of Biochemistry, Western Reserve University, Cleveland. Paper. Price \$3.50. Pp. 288, with 17 illustrations. St. Louis: C. V. Mosby Company, 1942.

Biochemistry has been recognized as an important subject in the medical curriculum for many years and, more recently, detailed work in this subject has been given in schools of dentistry. The present loose leaf manual of directions for laboratory work for a course of biochemistry in medical schools and in dental schools will be viewed with interest by many teachers of biochemistry. The author states that the directions were prepared originally for his students at the Albany Medical College in 1910. The original manual has been revised each year, and today the directions for laboratory work in biochemistry are thoroughly in keeping with newer developments of the subject. The directions for experiments are divided into sections on introductory biochemistry and clinical biochemistry and a course in practical laboratory work for dental students. An outline of the plan of lectures and laboratory work as presented at Western Reserve University is provided so that the suggested laboratory work may be easily correlated with other schedules of subject presentation. The introductory section deals with the biochemistry of carbohydrates, lipids, proteins, tissues, digestion and excretion. The clinical portion contains chapters on gastric analysis, the examination of duodenal contents, the chemistry of feces and the examination of the urine for clinical purposes and an extended section on the chemical analysis of blood. The laboratory program for dental students is somewhat shorter. In place of exercises on clinical biochemistry, attention is devoted to the analysis of saliva and the quantitative aspects of biochemistry and because some students may not have had sufficient training in this subject the author includes in the appendix a discussion of visual and photoelectric colorimeters and a series of experiments for students who have not completed a course in quantitative analysis. The manual is well written and suitably illustrated and it should be generally useful.

The Art of Living in Wartime By Marjorie Barstow Greenble. Cloth. Price \$2.50. Pp. 266. New York & London: Whitlsey House, McCraw-Hill Book Company, Inc., 1943.

The title of this delightful book might well have been simply "The Art of Living." Its wartime angles are distinctly timely and helpful, but its value will not be limited to wartime except to those who in the peace to come may be prevented from reading it by its title. It is a sound, sane, solid, helpful book, but it is much more. It gives the impression of growing out of a living experience in which life's problems have been faced with serenity and success. It manages to be inspiring without striving for effect and it achieves dignity without pomposity. The chapter titles are ingenious. Typical among them are "The Gallant Art of Facing It," "The Heroic Art of Overtime," "The Difficult Art of Taking It Easy," "The Discarded Art of Filial Piety," "The Fundamental Art of Love," "The Lusty Art of Keeping Fit" and "The Thankless Art of Doing One's Bit." In style and general approach it is reminiscent of David Grayson's "Adventures in Contentment" and similar writings keyed to a more tranquil age. It is packed with hope, courage, humor and helpfulness at a time when nothing is needed more. This is a book that will give the reader a lift. It should be especially good reading for persons whose maladjustments to wartime living threaten to have unfavorable repercussions on their emotional and eventually their physical and mental health. To any such patient the physician need not hesitate to recommend it.

The Vitamins in Medicine By Franklin Blechman, D.M., M.R.C.P., and Frederick Prescott, M.Sc., Ph.D., A.I.C., Clinical Research Director, The Wellcome Foundation, London. Cloth. Price 45s. Pp. 662, with 121 illustrations. London: William Heinemann Medical Books Ltd., 1942.

This book is intended as a comprehensive survey of the vitamins with emphasis on the clinical aspect of the subject. The contents include chapters on vitamin A, vitamin B complex and its known factors, and vitamins C, D, E, F, K and P. Each vitamin is considered from the point of view of history, physi-

ology, sources and food tables, effects of cooking, storage, human requirements in health and disease, clinical and biochemical methods of detecting deficiencies and conditions in which it has been used clinically.

Unfortunately in an attempt to make the compilation complete these authors have included references to reports that are in need of considerable supporting evidence. In certain sections emphasis seems to be placed on a summary of experimental work rather than proved clinical facts as the title of the book suggests. Some readers will accept such references as an invitation for vitamin therapy in instances in which their use is not justified. Probably this must be expected in books that are intended as comprehensive surveys.

If this book is read for provocative thought much satisfaction will result. If it is used entirely as a guide for vitamin therapy in general practice occasional disappointment may result. However the contents of the book are well arranged and well indexed and cannot help but leave the reader rently aware of vitamin deficiencies. Bibliographies at the end of each chapter contain the titles of over three thousand papers and supplement the value of the book as a reference and therapeutic guide.

Manual for Managers of Rural and Other Small School Lunchrooms Prepared and published by the Ohio Dietetic Association with the cooperation of the following agencies: Ohio State Department of Health, Ohio Department of Education, Division of Vocational Education, Ohio State University, School of Home Economics, Division of Institutional Management, World's Progress Administration, Committee from the Ohio Home Economics Association, Cleveland Health Council. Paper. Price \$1.00. Pp. 22. Cleveland: Ohio Dietetic Association, 1942.

This is an eminently practical manual in loose leaf form for managers of rural and other small lunchrooms. It has been prepared by a committee of the Ohio Dietetic Association with the cooperation of a number of health agencies. The greater part of the book is devoted to recipes for a large number of nourishing dishes. The ingredients are listed for serving twelve, twenty-five or fifty persons. Each recipe takes up one page. The method of preparation is described clearly, and at the bottom of the page there are many suggestions showing the way in which the particular preparation may be used in a meal. The authors have not neglected to include an adequate index. The first part of the book contains discussions on such subjects as the educational possibilities of the school lunchroom, what a satisfactory lunch should consist of and how to select it. There is an interesting section on quantity cooking with a list of reference books appended. A chapter on equipment with numerous charts of arrangements of lunchroom and kitchen enhances the usefulness of the volume. Chapters on food purchasing, food cost accounting and food sanitation are also included.

Tobacco and Health. Some Facts About Smoking By Arthur H. Steinhilber, Professor of Physiology, George Williams College, and Florence M. Crunderman, Assistant in Biological Science, George Williams College. Third edition. Paper. Price 35 cents. Pp. 48. New York: Association Press, 1942.

This is a summary on effects of tobacco in relation to health, based on the theory that the average citizen given all the facts ought to be capable of making up his mind, especially if he is told how the facts are developed. Following this theory the authors have taken the various phases of tobacco smoking and have set down what they conceive to be the facts for and against the use of tobacco in various forms. Typical of their approach is the handling of the question of smokers versus nonsmokers in athletics. In this section which constitutes chapter VII of the brief monograph they deal with performance in cross country runs by heavy smokers, moderate smokers, nonsmokers and the totals. These are all in favor of the nonsmokers. With respect to sprints they indicate that there is no difference between the performance of smokers and nonsmokers. In swimmers nonsmokers have the advantage. Then follows the physiologic explanation and the conclusion that "Smoking does 'cut the wind of an athlete'." Most chapters are followed by questions which lead to further discussion. There is an extensive bibliography, and every statement in the brief summary is documented according to the bibliography. This should be a useful teaching instrument.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT NECESSARILY REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

VACCINES AND TUBERCULOSIS

To the Editor—Has any vaccine been developed which would be suitable for vaccination against tuberculosis? If an effective vaccine has been developed I should appreciate your giving me the technique and materials used.

Herman I. Pifer, M.D., Winchester, Va.

ANSWER—Many vaccines have been developed for tuberculosis, but few have survived the experimental trials. Koch's old tuberculin was intended originally as a vaccine, but the huge doses frequently caused disaster to tuberculous patients. A long list of nonviable vaccines have been recommended, but the details are irrelevant. Ponderi, von Ruck, Deycke and many more less well publicized products came and have gone, with a large number of experimental varieties. Of the "living" vaccines (made of living bacilli) including Friedmann's, Selter's, Raw's and Calmette's, only the latter is still used. Calmette's BCG (named *Bacillus Calmette-Guerin* after the authors) is an avirulent bovine type of tubercle bacillus isolated twenty-five years ago and grown on bilated potato medium since. It has been used extensively in Europe and South America, but only a few in North America have given it an adequate trial, and the trials here have been largely experimental. Among those who have studied it here are Park, Watson, Ferguson, Aronson and Rosenthal.

There has been a heated controversy over the possible value of BCG. One group, consisting of Myers and Stewart, feels that sensitization is prone to lead to more "destructive" action on the tissues on reinfection and that primary infections are more benign and to be preferred. Furthermore, they reason that it is better to try to prevent infection by removal of contacts and better quarantine rather than attempt to build a dubious immunity. On the other hand, most experimental evidence supports the thesis that vaccination protects relatively against a later reinfection, that it isn't always possible to prevent tuberculous infection and that removal of contacts should be done first, but that when it is not possible, as in poor districts or in those exposed to tuberculosis, the vaccine will be a protection. They reason further that if one healed infection protects against a reinfection why shouldn't an avirulent and harmless bacillus as BCG be given to confer the protection rather than risk a virulent infection which may come at an inopportune time and place and may result in disease?

The vaccine BCG was originally made by the Pasteur Institute, Paris, under Calmette's direction, but it is not possible to get it from that source now. The manufacture of the vaccine is done only under the most stringent precautions to prevent a repetition of the now famous "Lubeck disaster" in Lubeck, Germany, where over 70 infants died because a virulent tubercle bacillus had accidentally contaminated the vaccine. The culture is grown on Sauton's medium and bilated glycerum potato medium. The bacilli are taken up from Sauton's medium, washed, weighed, diluted and administered either by mouth by subcutaneous injection or by the multiple puncture method of Rosenthal. The minute details of preparation, preservation, prevention of contamination and use had better be obtained from one of those using the vaccine, such as Aronson of the Henry Phipps Institute, Philadelphia, Rosenthal of the Municipal Tuberculosis Sanitarium, Chicago, or Watson of the Dominion government, Ottawa, Canada.

HEMOPTYSIS AND METASTATIC ABSCESS WITHOUT RIB FRACTURE

To the Editor—A civilian employee at this post was driving a small Chisel ' truck when the wheels hit a beam causing the steering wheel to spin violently to the left. The force of this spin was communicated directly to his left hand and thence to his shoulder and back by reason of his effort to stop the motion with his extended arm. As a direct result of this forceful wrenching of his shoulder and back muscles he suffered immediate severe excruciating pain especially over the infraspinatus and the teres major as well as the posterior axillary muscles. There was a definite paresthesia down to the left wrist. We thought at first that he was a malingerer. Two days subsequently the man developed a temperature of 102 F. the pain remained and motion of the entire arm was considerably limited. There was hemoptysis on two occasions. After eight days there was some evidence of fluctuation over the scapula inferior to the spine. Paresthesia had disappeared and the temperature was still fluctuating. An incision was made over the fluctuating area and a large amount of dark brown purulent material was evacuated. The cavity was found to extend below the scapula where the ribs formed a part of its wall. Culture of the material revealed nonhemolytic streptococci to be the causative organism. Repeated roentgenograms of the ribs and scapula were negative. 1. What was the source of the hemoptysis forty-eight hours after the injury with negative lung findings? 2. Was the abscess caused by the breaking down of a subcutaneous hematoma or was it entirely hematogenous without relationship to the injury? 3. How could the possibility of the development of such a condition be anticipated so as to avoid charging the patient with malingerer?

M. D. New Jersey

ANSWER—This is an interesting case and it is difficult to answer the questions posed with assurance.

1. With regard to the hemoptysis without rib fractures and negative lung findings, it can only be surmised that the shock of the injury caused a minor damage to the finer bronchioles with a minute amount of hemorrhage.

2. The abscess seems definitely in the class of metastatic abscesses (see Christopher, Frederick, *Minor Surgery*, ed. 4 Philadelphia W. B. Saunders Company, 1940, pages 2 and 3, for three illustrative cases). A metastatic abscess presupposes an injury plus a distant focus of infection. It may be a boil or possibly even a throat infection (see also Sante, L. R. *Ann. Surg.* 89: 772 [May] 1920).

3. It would seem wise to avoid the charge of malingerer until a week or more has gone by in any case of injury. When it is definitely suspected, psychiatric aid is often of great benefit.

DERMATITIS AND VENOUS STASIS

To the Editor—Is an underlying (sub)cutaneous phlebitis the cause of stasis dermatitis? This question is ignored in all textbooks.

T. S. Saunders, M.D., Portland, Ore.

ANSWER—Stasis dermatitis, often called varicose eczema, is not necessarily of uniform causation. It is most commonly seen in conjunction with severe stasis in the superficial venous system, whereas it is infrequently encountered after deep venous obstruction. It is practically never seen in patients with an acute phlebitis but it is true that chronic or even latent types of phlebitis, manifesting painful, thickened saphenous veins seem to be associated with stasis dermatitis. That venous stasis with consequent high capillary pressure and increased capillary permeability is an important factor is best shown by the fact that putting the patient to bed with elevated lower extremities or bandaging the leg with an elastic bandage often produces improvement.

This, however, is only part of the difficulty. Patients suffering from such dermatitis often have sensitive skins and may have hay fever or are sensitive to foods. Often the dermatitis may have started locally, over an inflamed vein, but becomes generalized, probably after scratching or rubbing the antigen into the systemic circulation. Then again there may be a ringworm infection between the toes acting as the origin of skin allergy. Much effort may have to be expended to track down the origin of such cutaneous allergies. Certain it is that venous stasis accentuates and helps to localize such 'in reactions, but venous stasis alone does not account for the allergic manifestations and the great resistance to treatment, which should be directed equally toward the elimination of stasis and allergens of the most varied sorts.

EROSIONS AND ULCERATIONS OF CERVIX

To the Editor—There have been various references in the literature to the iodine test for cervical carcinoma. Normal cervical mucous membrane is supposed to take a brown stain because of the glycogen, while tissue that remains white is supposed to be cancerous or precancerous. I have routinely painted the cervix with 3.5 per cent iodine in the cases I have had in the last few months. In most cases there is a sharply outlined area 1 to 4 cm in diameter that does not take the iodine stain. This area is usually larger but never smaller than any cervical "erosion." That is an ulcerated cervix or the columnar epithelium that lines the cervix does not seem to take the stain. The area which is outside the erosion which fails to take the iodine stain often appears otherwise to be healthy epithelium. Does this finding have any clinical significance? Certainly they are not all precancerous. Biopsies of eroded or roughened areas showed no demonstrable change except three. One was reported as leukoplakia grade 1, one leukoplakia with precancerous changes and the third as adenocarcinoma. I should like to know the significance of the pink so called erosion that is often seen surrounding the cervical os that increases and decreases in size with the menstrual cycle. It is often seen in women who have no history of pregnancy or cervical disease. M D Arizona

ANSWER—Persistence of a white unstained appearance on application of Gram's iodine solution is not diagnostic of cancer but is merely suggestive of areas which may merit biopsy study. Erosions, ulcerations and various leukoplakic, i. e. "white patches" all fail to take the iodine stain. It is therefore evident that the Schiller test really has only limited application.

An erosion is customarily defined as a reddened or congested area on the vaginal surface of the cervix covered by a layer of columnar epithelium. Most teachers of gynecology take exception to the assumption that these areas are "ulcerated." Notwithstanding the accepted definition of an erosion, study of these lesions reveals that a large percentage are actually devoid of an epithelial covering, the surface is often composed of granulation tissue infiltrated with polymorphonuclear leukocytes and extensively invaded by bacteria. Erosions present a salmon red or pink appearance. There may be only a small area surrounding the external os, or the greater portion of the vaginal surface of the cervix may be involved. The interior cervical lip is particularly subject to this lesion.

PREGNANCY AND DIABETES—CESAREAN SECTION

To the Editor—I should like to know the present status of endocrine treatment in pregnancy for a person with diabetes. I should also like to know whether it is the present consensus that severe diabetes constitutes an indication for cesarean section especially for early cesarean section with a view to lowering fetal mortality. References on both of these points would be appreciated.

William F. Putnam, M.D., Lyme, N. H.

ANSWER—There is a certain amount of disagreement concerning the management of the pregnant patient with diabetes. This concerns the viability of the fetus rather than the mother, for whom all groups expect survival almost equal to that of nondiabetic mothers. As for the fetus one group of workers maintains that adequate obstetric and diabetic care of the mother favors fetal survival and that nothing further is indicated. Others who also treat many diabetic patients think this is not the case, because, even with adequate diabetic and obstetric care, the fetal survival is still below 80 per cent. In one experience, based on 125 cases, the obstetric diabetic patients may be divided into two groups, according to their normal or abnormal hormonal pattern. If this is normal, the clinical course and the fetal survival approach that of nondiabetic pregnancies, but when it is abnormal the outcome is definitely otherwise.

Among 41 patients of the normal hormonal type the fetal survival was 95 per cent, which is comparable with that of nondiabetic fetal survivals. Among 27 patients in whom the pattern was abnormal and untreated the fetal survival was 61 per cent. Four of the ten deaths were stillbirths and six were neonatal (within twenty-four hours of delivery). Diabetic care was adequate in all.

The mother's clinical picture associated with the imbalance was either premature delivery or the development of preeclamptic toxemia which was mild, so far as the mother was concerned, but carried with it a high fetal mortality.

For the 57 patients with abnormal hormonal patterns for whom attempts were made through estrogen and progestin therapy to restore the hormonal balance to normal, the fetal survival has been comparable to that of the normal hormonal pattern, 91 per cent.

Among these patients, weekly determinations for chorionic gonadotropin and pregnandiol are employed to anticipate premature delivery and preeclamptic toxemia. If the chorionic gonadotropin rises or the pregnandiol falls, standard endocrine therapy is used. Usually intramuscular injections of diethylstilbestrol, an average dose being 15 mg daily, and intramus-

cular injections of progesterone, the equivalent of 10 mg daily, are given. Treatment is adjusted according to the hormone levels.

If laboratory facilities are not available threatened premature deliveries should be treated with progesterone 10 to 50 mg. If the patient is gaining weight rapidly and develops edema, hypertension or albuminuria, estrogen and progestin therapy may be employed, namely diethylstilbestrol 15 mg and progestin 10 mg intramuscularly. The dosage may be adjusted by symptoms.

For patients with abnormal hormonal balance even under treatment or with clinical signs of toxemia a premature delivery is indicated, and the time which has been selected is in the thirty-seventh week. Whether delivery should be by cesarean section or otherwise must be determined by conference between obstetrician and internist in each individual case. There is no absolute rule. Breech presentations, hydrannios and gigantism are clinical indications for cesarean section. Multiparous patients, those whose infants appear small and whose clinical course has been normal are candidates for normal delivery.

Although the infant of the diabetic mother appears post mature its behavior is that characteristic of prematurity. Oxygen incubation, heat and postponement of feeding for twenty-four hours are routine in the writer's clinic. Dextrose is not believed to be indicated unless the blood sugar is still falling at the end of eight hours. It may be employed in 5 per cent solution.

Inhalation anesthesia at delivery and premedication are used in only minimal amounts.

HEMOLYTIC ESCHERICHIA COLI IN FECES AND VACCINE THERAPY

To the Editor—Would you be kind enough to let me know the present status of hemolytic *Escherichia coli* from feces as a pathogen in various diseases? I have in mind an article by Niles and Torrey published some years ago on this subject. What is the present prevailing opinion with regard to the therapeutic value of treatment with vaccines prepared from such strains of organisms? Jacob Levine, M.D., Winston Salem, N. C.

ANSWER—Hemolytic strains of *Escherichia coli* are commonly found in the feces of healthy persons. There is no proof that these strains give rise to a toxemia in simple colitis (irritable colon), ulcerative colitis, urticaria, angioneurotic edema, renal acute necrosis, eczema, pruritus, fibrositis and pelvis which is the list of conditions treated by Niles and Torrey (Niles, Walter L., and Torrey, John C. The Clinical Significance of *B. Coli Hemolyticus*, *Am J Hyg* 187:30 [Jan] 1934). Vaccines are not widely used at the present time in treating these diseases, and any benefit derived from them is probably nonspecific.

SNAKES AND DESERT LIFE OF SOUTHWESTERN UNITED STATES

To the Editor—I am interested in any information regarding the types of animal life especially snakes to be found in the desert at Indio, Calif. A. Abrams Major, M. C. A. U. S.

ANSWER—Gracie B. Pickwell's book *Deserts* (New York, Whittlesey House, McGraw-Hill Company, 1939) is undoubtedly the best recent account of the desert life of southwestern United States. There is no good account of desert snakes as such, but the *Field Book of Snakes of the United States and Canada* by K. P. Schmidt and D. D. Davis (New York, G. P. Putnam's Sons, 1941) should be helpful. *What Snake Is That?* by Roger Conant and William Bridges (New York, D. Appleton Century Company, 1939) is less technical.

SEBACEOUS CYSTS OF CHIN

To the Editor—In *Queries and Minor Notes* in The Journal Feb 13 1943, for treatment of a patient with many small sebaceous cysts about her chin incident to acne you advised roentgen therapy, eight to ten treatments at weekly intervals with a dosage of 75 to 80 roentgens unfiltered and stated that most cases of this type will respond to this form of treatment. The prescription as given is not properly descriptive as the quality (voltage) is not specified nor the focal distance. Aside from that I cannot conceive of any sebaceous cyst responding to such therapy except for a temporary improvement to cure a sebaceous cyst secondary to acne or to a blockhead the wall of the cyst must be destroyed or removed and this is accomplished by surgery. Roentgen therapy is very beneficial in pustular acne with which cystic acne is often associated too frequently repeated x-ray treatments, given for cystic acne will result in permanent skin damage so that the patient will have the cysts plus a damaged atrophic skin. In twenty years of experience I have not seen a single sebaceous cyst cured by x-rays I have seen several cases of permanent skin damage caused by ill advised roentgen therapy.

W. H. Whitmore, Commander M. C. U. S. Navy retired Norfolk, Va.

JOURNALS ABSTRACTED IN THE CURRENT MEDICAL LITERATURE
DEPARTMENT, JANUARY-APRIL 1943

Titles have been listed or abstracts made of important articles in the following journals in the Current Literature Department of THE JOURNAL during the past four months. Any of the journals except those starred, will be lent by THE JOURNAL to subscribers in continental United States and Canada and to members of the American Medical Association for a period not exceeding three days. Three journals may be borrowed at a time. No journals are available prior to 1933. Requests for periodicals should be addressed to the Library of the American Medical Association and should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Thus most of these journals are accessible to the general practitioner.

SUBJECT INDEX

This is an index to all the reading matter in *THE JOURNAL*. In the Current Medical Literature Department only the articles which have been abstracted are indexed.

The letters used to explain in which department the matter indexed appears are as follows: "BI," Bureau of Investigation, "E," Editorial, "C," Correspondence, "OS," Organization Section, "ab," abstracts, the star (*) indicates an original article in *THE JOURNAL*.

This is a subject index and one should, therefore, look for the subject word, with the following exceptions: "Book Notices," "Deaths," "Medicolegal Abstracts" and "Societies" are indexed under these titles at the end of the letters "B," "D," "M," and "S." State board examinations are entered under the general heading State Board Reports, and not under the names of the individual states. Matter pertaining to the Association is indexed under "American Medical Association." The name of the author, in brackets, follows the subject entry.

For author index see page 1472
